OPERATION MANUAL

MAYCO SERIES
MODEL LS450
CONCRETE PUMP
(HATZ 4H50 DIESEL ENGINE)

Revision #1 (09/09/19)

To find the latest revision of this publication or associated parts manual, visit our website at: www.multiquip.com

THIS MANUAL MUST ACCOMPANY THE EQUIPMENT AT ALL TIMES.
WARNING
CANCER & REPRODUCTIVE HARM
www.P65Warnings.ca.gov
P/N 38707
Grinding/cutting/drilling of masonry, concrete, metal and other materials with silica in their composition may give off dust or mists containing crystalline silica. Silica is a basic component of sand, quartz, brick clay, granite and numerous other minerals and rocks. Repeated and/or substantial inhalation of airborne crystalline silica can cause serious or fatal respiratory diseases, including silicosis. In addition, California and some other authorities have listed respirable crystalline silica as a substance known to cause cancer. When cutting such materials, always follow the respiratory precautions mentioned above.

**WARNING**

Grinding/cutting/drilling of masonry, concrete, metal and other materials can generate dust, mists and fumes containing chemicals known to cause serious or fatal injury or illness, such as respiratory disease, cancer, birth defects or other reproductive harm. If you are unfamiliar with the risks associated with the particular process and/or material being cut or the composition of the tool being used, review the material safety data sheet and/or consult your employer, the material manufacturer/supplier, governmental agencies such as OSHA and NIOSH and other sources on hazardous materials. California and some other authorities, for instance, have published lists of substances known to cause cancer, reproductive toxicity, or other harmful effects.

Control dust, mist and fumes at the source where possible. In this regard use good work practices and follow the recommendations of the manufacturers or suppliers, OSHA/NIOSH, and occupational and trade associations. Water should be used for dust suppression when wet cutting is feasible. When the hazards from inhalation of dust, mists and fumes cannot be eliminated, the operator and any bystanders should always wear a respirator approved by NIOSH/MSHA for the materials being used.
# TABLE OF CONTENTS

**LS450 Concrete Pump**

- Proposition 65 Warning .................................................. 2

**NOTICE**

Specifications are subject to change without notice.
Do not operate or service the equipment before reading the entire manual. Safety precautions should be followed at all times when operating this equipment. Failure to read and understand the safety messages and operating instructions could result in injury to yourself and others.

SAFETY MESSAGES

The four safety messages shown below will inform you about potential hazards that could injure you or others. The safety messages specifically address the level of exposure to the operator and are preceded by one of four words: DANGER, WARNING, CAUTION or NOTICE.

SAFETY SYMBOLS

<table>

Potential hazards associated with the operation of this equipment will be referenced with hazard symbols which may appear throughout this manual in conjunction with safety messages.
SAFETY INFORMATION

GENERAL SAFETY

⚠️ CAUTION

- NEVER operate this equipment without proper protective clothing, shatterproof glasses, respiratory protection, hearing protection, steel-toed boots and other protective devices required by the job or city and state regulations.
- NEVER operate this equipment when not feeling well due to fatigue, illness or when on medication.
- NEVER operate this equipment under the influence of drugs or alcohol.

⚠️ NOTICE

- This equipment should only be operated by trained and qualified personnel 18 years of age and older.
- Whenever necessary, replace nameplate, operation and safety decals when they become difficult to read.
- Manufacturer does not assume responsibility for any accident due to equipment modifications. Unauthorized equipment modification will void all warranties.
- NEVER use accessories or attachments that are not recommended by Multiquip for this equipment. Damage to the equipment and/or injury to user may result.
- ALWAYS know the location of the nearest fire extinguisher.
- ALWAYS know the location of the nearest first aid kit.
- ALWAYS know the location of the nearest phone or keep a phone on the job site. Also, know the phone numbers of the nearest ambulance, doctor and fire department. This information will be invaluable in the case of an emergency.

PUMP SAFETY

⚠️ DANGER

- NEVER pump volatile, explosive, flammable or low flash point fluids. These fluids could ignite or explode.
- The engine fuel exhaust gases contain poisonous carbon monoxide. This gas is colorless and odorless, and can cause death if inhaled.
- The engine of this equipment requires an adequate free flow of cooling air. NEVER operate this equipment in any enclosed or narrow area where free flow of the air is restricted. If the air flow is restricted it will cause injury to people and property and serious damage to the equipment or engine.
- NEVER operate the equipment in an explosive atmosphere or near combustible materials. An explosion or fire could result causing severe bodily harm or even death.

⚠️ WARNING

- NEVER pump corrosive chemicals or water containing toxic substances. These fluids could create serious health and environmental hazards. Contact local authorities for assistance.
- NEVER operate the pump with closed discharge hose. The liquid could reach boiling temperatures, build pressure, and cause the casing to rupture or explode.
- NEVER disconnect any emergency or safety devices. These devices are intended for operator safety. Disconnection of these devices can cause severe injury, bodily harm or even death. Disconnection of any of these devices will void all warranties.
SAFETY INFORMATION

![CAUTION]

■ NEVER lubricate components or attempt service on a running machine.

■ NEVER block or restrict flow from discharge hose. Remove kinks from discharge line before starting pump. Operation with a blocked discharge line can cause water to overheat.

■ DO NOT operate this equipment unless the hopper grate, guards and safety devices are attached and in place.

■ CAUTION must be exercised while servicing this equipment. Rotating and moving parts can cause injury if contacted.

■ Keep hands out of the hopper when the engine is running.

![NOTICE]

■ In winter drain water from the lubrication box to prevent freezing.

■ ALWAYS be sure the operator is familiar with proper safety precautions and operation techniques before using pump.

■ Keep all inexperienced and unauthorized people away from the equipment at all times.

■ Before start-up, check the hopper and remove all foreign matter and debris.

■ DO NOT use worn or damaged hose couplings, inspect all hoses and couplings for wear. Replace any worn or defective hoses or couplings immediately.

■ Unauthorized equipment modifications will void all warranties.

■ Check all fasteners periodically for tightness. Also check towing tongue bolt, lock nut and wheel lug nuts for wear.

■ Test the pump’s emergency stop switch. The purpose of this test is to shut down the engine in the event of an emergency.

■ Refer to the Engine Owner’s Manual for engine technical questions or information recommended by Multiquip for this equipment. Damage to the equipment and or injury to user may result.

■ ALWAYS remove the ignition key when leaving the pump unattended.

■ ALWAYS block the wheels on the unit when using on a slope.

■ ALWAYS use properly rated hoses and clamps — 1,500 PSI or higher.

■ ALWAYS allow the pump a proper amount of time to cool before servicing.

■ ALWAYS keep the machine in proper running condition.

■ ALWAYS ensure pump is on level ground before use.

■ Fix damage to machine and replace any broken parts immediately.

■ ALWAYS store equipment properly when it is not being used. Equipment should be stored in a clean, dry location out of the reach of children and unauthorized personnel.

ENGINE SAFETY

![WARNING]

■ DO NOT place hands or fingers inside engine compartment when engine is running.

■ NEVER operate the engine with heat shields or guards removed.

■ DO NOT remove the engine oil drain plug while the engine is hot. Hot oil will gush out of the oil tank and severely scald any persons in the general area of the pump.

![CAUTION]

■ NEVER touch the hot exhaust manifold, muffler or cylinder. Allow these parts to cool before servicing equipment.
SAFETY INFORMATION

**NOTICE**

- NEVER run engine without an air filter or with a dirty air filter. Severe engine damage may occur. Service air filter frequently to prevent engine malfunction.

- NEVER tamper with the factory settings of the engine or engine governor. Damage to the engine or equipment can result if operating in speed ranges above the maximum allowable.

**FUEL SAFETY**

- DANGER
  - DO NOT start the engine near spilled fuel or combustible fluids. Fuel is extremely flammable and its vapors can cause an explosion if ignited.

- ALWAYS refuel in a well-ventilated area, away from sparks and open flames.

- ALWAYS use extreme caution when working with flammable liquids.

- DO NOT fill the fuel tank while the engine is running or hot.

- DO NOT overfill tank, since spilled fuel could ignite if it comes into contact with hot engine parts or sparks from the ignition system.

- Store fuel in appropriate containers, in well-ventilated areas and away from sparks and flames.

- NEVER use fuel as a cleaning agent.

- DO NOT smoke around or near the equipment. Fire or explosion could result from fuel vapors or if fuel is spilled on a hot engine.

**BATTERY SAFETY**

- DANGER
  - DO NOT drop the battery. There is a possibility that the battery will explode.

- DO NOT expose the battery to open flames, sparks, cigarettes, etc. The battery contains combustible gases and liquids. If these gases and liquids come into contact with a flame or spark, an explosion could occur.

- WARNING
  - ALWAYS wear safety glasses when handling the battery to avoid eye irritation. The battery contains acids that can cause injury to the eyes and skin.

  - Use well-insulated gloves when picking up the battery.

  - ALWAYS keep the battery charged. If the battery is not charged, combustible gas will build up.

  - DO NOT charge battery if frozen. Battery can explode. When frozen, warm the battery to at least 61°F (16°C).

  - ALWAYS recharge the battery in a well-ventilated environment to avoid the risk of a dangerous concentration of combustible gases.

  - If the battery liquid (dilute sulfuric acid) comes into contact with clothing or skin, rinse skin or clothing immediately with plenty of water.

  - If the battery liquid (dilute sulfuric acid) comes into contact with eyes, rinse eyes immediately with plenty of water and contact the nearest doctor or hospital to seek medical attention.

- CAUTION

  - ALWAYS disconnect the NEGATIVE battery terminal before performing service on the equipment.

  - ALWAYS keep battery cables in good working condition. Repair or replace all worn cables.
SAFETY INFORMATION

TRANSPORTING SAFETY

⚠️ CAUTION ⚠️

NEVER allow any person or animal to stand underneath the equipment while lifting.

NOTICE

Before lifting, make sure that the equipment parts are not damaged and screws are not loose or missing.

ALWAYS make sure forklift forks are inserted into pockets (if applicable) as far as possible when lifting the pump.

ALWAYS shut down engine before transporting.

NEVER lift the equipment while the engine is running.

Tighten fuel tank cap securely to prevent fuel from spilling.

Use one-point suspension hook and lift straight upwards.

DO NOT lift machine to unnecessary heights.

ALWAYS tie down equipment during transport by securing the equipment with straps, rope or chains.

TOWING SAFETY

⚠️ CAUTION ⚠️

Check with your local county or state safety towing regulations, in addition to meeting Department of Transportation (DOT) Safety Towing Regulations, before towing your pump.

In order to reduce the possibility of an accident while transporting the pump on public roads, ALWAYS make sure the trailer that supports the pump and the towing vehicle are mechanically sound and in good operating condition.

ALWAYS shut down engine before towing.

Make sure the hitch and coupling of the towing vehicle are rated equal to or greater than the trailer gross vehicle weight rating.

ALWAYS inspect the hitch and coupling for wear. NEVER tow a trailer with defective hitches, couplings, chains, etc.

Check the tire air pressure on both towing vehicle and trailer. Trailer tires should be inflated to 80 psi cold. Also check the tire tread wear on both vehicles.

ALWAYS make sure the trailer is equipped with a safety chain.

ALWAYS properly attach trailer’s safety chains to towing vehicle.

ALWAYS make sure the vehicle and trailer directional, backup, brake and trailer lights are connected and working properly.

DOT requirements include the following:

• Connect and test electric brake operation.

• Secure portable power cables in cable tray with tie wraps.

The maximum speed for highway towing is 55 MPH unless posted otherwise. Recommended off-road towing is not to exceed 15 MPH or less depending on type of terrain.

Avoid sudden stops and starts. This can cause skidding or jack-knifing. Smooth, gradual starts and stops will improve towing.

Avoid sharp turns to prevent rolling.

Trailer should be adjusted to a level position at all times when towing.

Raise and lock trailer wheel stand in up position when towing.

Place chock blocks underneath wheels to prevent rolling while parked.

Place support blocks underneath the trailer’s bumper to prevent tipping while parked.

Use the trailer’s swivel jack to adjust the trailer height to a level position while parked.
ENVIRONMENTAL SAFETY/DECOMMISSIONING

**NOTICE**

Decommissioning is a controlled process used to safely retire a piece of equipment that is no longer serviceable. If the equipment poses an unacceptable and unrepairable safety risk due to wear or damage, or is no longer cost effective to maintain (beyond life-cycle reliability) and is to be decommissioned (demolition and dismantlement), be sure to follow the rules below.

- **DO NOT** pour waste or oil directly onto the ground, down a drain or into any water source.
- Contact your country’s Department of Public Works or recycling agency in your area and arrange for proper disposal of any electrical components, waste or oil associated with this equipment.
- When the life cycle of this equipment is over, remove battery and bring to appropriate facility for lead reclamation. Use safety precautions when handling batteries that contain sulfuric acid.
- When the life cycle of this equipment is over, it is recommended that the frame and all other metal parts be sent to a recycling center.

Metal recycling involves the collection of metal from discarded products and its transformation into raw materials to use in manufacturing a new product.

Recyclers and manufacturers alike promote the process of recycling metal. Using a metal recycling center promotes energy cost savings.

EMISSIONS INFORMATION

**NOTICE**

The diesel engine used in this equipment has been designed to reduce harmful levels of carbon monoxide (CO), hydrocarbons (HC) and nitrogen oxides (NOx) contained in diesel exhaust emissions.

This engine has been certified to meet US EPA evaporative emissions requirements in the installed configuration.

Attempting to modify or make adjustments to the engine emission system by unauthorized personnel without proper training could damage the equipment or create an unsafe condition.

Additionally, modifying the fuel system may adversely affect evaporative emissions, resulting in fines or other penalties.

**Emission Control Label**

The emission control label is an integral part of the emission system and is strictly controlled by regulations.

The label must remain with the engine for its entire life.

If a replacement emission label is needed, please contact your authorized engine distributor.

IMPORTANT HAND SIGNALS

Figure 2. Operation Hand Signals
CONCRETE MIX DESIGN

Mix design is most important to achieve maximum pumpability. Pumpability is affected by, among other factors, the type and gradation of aggregate used. Natural aggregates make a more workable mix and pump more readily than crushed aggregates. A blend of natural and crushed aggregates will produce a workable mix. The type and gradation of aggregates is as equally important for workability as the size and percentage of coarse aggregates in the mix.

The term aggregates describes all of the solid materials—from the largest rock to the smallest grain of sand—contained in the concrete mix.

Concrete mixes with a consistency as dry as one-inch slump and as wet as ten-inch slump have been pumped; but for maximum efficiency from the pump, a slump ranging from two to six inches will produce a more workable mix than one that contains more or less water.

The principle of concrete pumping is based on self-lubrication. As it moves through the transfer line, the concrete takes the shape of a plastic cylinder. It is forced through the transfer line on a film of mortar that is self-troweled to the service of the transfer line around its full periphery by the slug of concrete itself.

A slump rating should be used with discretion; it is not always a real indication of the pumpability of the mix. The concrete may be workable in the sense that it will readily flow into place, but the same mix may not respond to pressure.

Overly wet mixes tend to separate. In addition to affecting the strength and quality of the concrete, the delivery system will not tolerate separation. Overly dry mixes are similarly unsatisfactory if they lack plasticity and tend to be crumbly. To be properly pumped, the mix must be able to continuously coat the inside of the line with a lubricating seal of mortar.

There are four ways in which this seal can be lost:

1. By pumping excessively wet mixes which do not have enough cohesion to hold together.
2. By pumping harsh, undersanded concrete with poorly graded aggregates which can jam together when the pressure becomes too great for the insufficient amount of sand to hold the aggregates apart.
3. By getting a rock pocket, such as mixer tailings, into the pump valve. This rock pocket will have an insufficient coating of mortar and the mix will not be plastic enough to allow the valve to operate or the mix to move in the line.
4. Through excessive bleeding. If the mix is short of fines, but the sand is otherwise fairly well graded, bleeding will not normally create any problems as long as the pump continues operation. But if the pump is shut down, bleeding can result in a loss of lubrication and blocked, erratic flow.

The above are bad concrete practices, regardless of how the mix is to be placed. But these points do show that special mixes are not always needed, within limits, for pumping concrete. Good aggregate gradation is most important to pump concrete the maximum distance.

The use of admixtures can have a beneficial effect on pumpability. Most of the dispersing agents will fatten, retard bleeding, and increase workability. Thus, the average concrete can be pumped for appreciably longer distances. Air entraining agents will also improve workability, although they cannot be used as a substitute for good gradation of the aggregate.

Pumping will not appreciably affect the final air content of the mix. High-early cement tends to give a more readily pumpable mix with superior water-retaining qualities. However, if delays are likely to occur, extra care must be exercised due to the faster setting time over regular cement.

The Mayco LS450 will pump a wide variety of concrete pump mixes, but there are guidelines that must be followed. Use this information in conjunction with the Operation section of this manual.

REGIONAL DIFFERENCES

Concrete is made by mixing locally available rock and sand with cement and water. For this reason there are great differences in the pumpability of concrete from one region of the country to another.

It is impossible to define a specific mix for each region that the concrete pump be will working in. Therefore, the mixes listed in Appendix — Concrete Mix Information will provide a basic guideline for establishing the proper mix design for your area.
Use this information to specify your requirements to your local ready-mix batch plant, contractor, and civil engineer. It may take minor adjustments to make a mix pumpable, so you should explain your needs.

The elements that have to be controlled and consistently maintained by the batch plant are:

1. The sizing and mix percentage of rocks, gap-graded from the largest down through the smallest sizes.
2. Sand with a sieve analysis that has the proper percentage of fines, ASTM C33 spec.
3. Sufficient cement to produce the required design strength of the concrete and provide the lubricating binder to pump the concrete through the delivery system. Use a minimum of:
   - 500 pounds of cement per cubic yard for 2,500 psi concrete after 28 days.
   - 530 pounds of cement per cubic yard for 3,000 psi concrete after 28 days.
   - 600 pounds of cement per cubic yard for 4,000 psi concrete after 28 days.
4. Admixture pump-aid if necessary.
5. The proper amount of water to make a workable slump and plasticize the mix.

In addition, this Mayco concrete pump can be used to pump a large aggregate hard rock as follows:

- Pea rock (1/2" minus) pump with mixes being as low as 30% rock and 70% sand. (Refer to the Maintenance section for recommendations on cleaning the pump.)
- Shortening pea rock when used with an air compressor and nozzle.
- “Mud jacking,” high pressure grouting.

### PUMPING INFORMATION

#### Remixture

Remixtures that are designed into the concrete mix by the ready-mix company or an architectural engineering company. This section lists common admixtures and a brief explanation of their functions:

1. **Pozzolith 300 (or equivalent)** — Acts as a water retarder and a lubricant. On a lean mix, long pushes, stiff mixes, and vertical pushes, Pozzolith 300R helps pumpability.
2. **MBVR** — Air entraining, acts as a lubricant.
3. **Calcium Chloride** — Commonly referred to as ‘C.C.’, is used as an accelerator. When pumping a load with calcium chloride, it is recommended that you wash out if the waiting time between delivery trucks becomes too long.
4. **Super Plasticizers** — Acts as an accelerator. The concrete will look very wet after the super plasticizer is added, but will begin to set up very fast. Wash out immediately if you do not have a truck waiting. Super plasticizers are used mainly on commercial jobs.
5. **Red Label** — Acts as a water retarder and an accelerator. Red label will be used mainly on commercial jobs.
6. **Fly Ash** — Is used to help increase the strength of the concrete and decrease the cement content per yard. This is one of the most common admixtures used.

#### NOTICE

All admixtures will be shown on the ready-mix concrete ticket. Before starting the pumping job, ask the driver of the ready-mix truck to see the concrete ticket. Note the admixtures that exist and take the proper action.

**Downhill Pumping**

Downhill pumping can be a difficult procedure on some jobs. The slurry procedure would be the same as explained in the Priming the Pump with Slurry Mixture section of this manual. It is suggested that a sponge approximately 2" × 4" × 6" in size be placed in the hose before the start of pumping.
Wet the sponge before placing it in the hose to keep the slurry from running too far ahead of the concrete, which will reduce the possibility of separation. When the pump is stopped, the material can flow slowly down due to gravity and cause the hose to collapse.

When pumping is resumed, you can expect blockage at the point of hose collapse. To prevent this from happening, the hose can be 'kinked off' at the discharge end when the pump is stopped to prevent the gravity flow of the material in the hose.

The use of stiffer mixes when pumping downhill will decrease gravity flow of the material in the hose and will assure a smoother operation between the cam roller bearing and cam plate. As with any job, make sure that the hose and the couplings are in good, workable shape.

**Vertical Pumping**

When pumping more than 40 feet vertically up the side of a building, the installation of steel pipe—securely fastened at intervals as necessary to support the pipe—is recommended. Ninety-degree, long-radius pipe sweeps should be installed at the top and bottom of the steel line.

Use a 25-foot hose or short section off the pump and use steel pipe for the balance of the horizontal distance to the vertical line. This type of installation has been satisfactory on many jobs being pumped in excess of 100 feet high. Line pressures are always less using steel pipe as compared to hose.

When pumping vertically using all hose, it is not recommended to go higher than 50 feet with the hose. The hose should be tied off at intervals of 10 feet if possible. Special attention should be given when tying the hose off at the top as the hose will have a tendency to stretch when filled with concrete. This will increase the possibility of a blockage at the point where the hose is tied off. To avoid this, a long-radius, 90-degree elbow is recommended. The suggested place to tie off is on the hose, under the clamp.

**NOTICE**

It is **strongly recommended** that steel pipe be used on all vertical pumping for safety and convenience.

**Hose Pulsation**

A slight pulsation of the hose will always be noticeable near the pump. Excessive pulsation of the hose near the pump is normally due to higher than average line pressures caused by stiff, harsh mixes or extremely long pumping distances.

The use of a 2-1/2" I.D. hose in these extreme cases reduces line pressures. Or, if permissible, the addition of slight amounts of water to the mix will allow easier pumping. The use of certain pumping admixtures may also help.

If excessive pulsation exists in the hose, it is advisable to use burlap or some other means of wear protection under the hose at points where the hose may wear through the outer cover (e.g. over forms, steel, or sharp curbs).

**Snap-Joint Couplings**

When using snap-joint couplings with gaskets to join hoses, make sure they are washed clean after each job. Keeping the hose ends clean (heavy duty) is very important for the best job setup. A thin coat of grease on the rubber gasket or dipping both coupling and gasket in water before coupling the hose will make for easier installation.

Fill the hopper with water after making sure that all sand and rock have been removed from the manifold. Operate the pump at full throttle and the 3/8-inch-diameter hole restriction will create sufficient back pressure to make thorough inspection of all moving parts.
The Effects Of Heat And Excessive Time On Concrete:

Hot concrete, commonly referred to as a hot load, is concrete that has been in the ready-mix truck in excess of 2 to 3 hours. On a hot day, this amount of time is even less.

A brief explanation of why heat and time affect concrete:

Concrete starts setting by drying up through a chemical reaction. The catalyst to this reaction is heat. When pumping a hot load, it is important to remember that when you have to stop pumping for any reason, add water to the concrete in the hopper and hand mix and move concrete in the hose every 5 minutes. If the shutdown time becomes too long, wash out immediately.

If it is necessary to wait 1/2 hour or more for another load of concrete, to prevent setting of the mix in the system, it is advisable to consider the following factors (A through D) affecting the concrete:

A. How old is the concrete?
B. Is there an accelerator, calcium chloride, red label, etc. in the concrete?
C. The temperature of the day—80, 90 degrees?
D. How much system you have out and how stiff was the mix you were pumping?

Preventing Mix Set-Up After Pump Shutdown

When the pump is stopped for any reason during a pour (e.g. moving hose, waiting for ready-mix truck), the following suggestions are offered:

1. Leave the hopper full of concrete at the time of shutdown. It is important to not let the ready-mix driver wash too much water into the hopper, as this could cause separation of the concrete in the hopper.

2. If the shutdown period exceeds 2 to 3 minutes, turn off the engine so the vibration does not separate the mix in the hopper which can cause a blockage in the manifold when the pump is started.

3. If it is necessary to wait 10 minutes or more for another load of concrete, it is wise to start the pump and pump 6 or 8 strokes every 5 minutes to prevent setting of the mix in the system. If waiting time is excessive, it would be wise to wash out the pump and hoses and start over when the new truck arrives.

4. When pumping stiff mixes and there is waiting time between ready-mix trucks, it is advisable to add some water to the last hopper of material and ‘hand mix’ to ensure an easier start with the following load.

5. When the pumping job requires a stiffer mix, the following method is suggested for starting: Take a water hose with a nozzle on it and apply water with a fine spray to the concrete as it comes down the ready-mix chute into the pump hopper after the slurry procedure is completed and you are ready to start pumping.

6. Using this procedure will make it easier to pump through the clean hose.

7. Hose sizing is very important: We strongly recommend that on harsh mixes, vertical pushes, stiff concrete, shotcrete, and long pushes, a 2-1/2" line be used as far as possible. The advantages of using the 2-1/2" line are improved pumpability, less pumping pressure and less wear on the pump.

8. Following the pump operation, proper washing out of all materials or ‘build-up’ within the pump manifold and hoses will prevent problems when starting the next job.

9. A thorough inspection of the drive components and greasing of all bearings after each job will ensure adequate lubrication and service to the pump which is normally operating in wet, gritty conditions.

NOTICE

Once the concrete has reached the end of the hose, DO NOT apply any more water in this manner as this procedure is used for starting only.

OVERGREASING ANY BEARING ON YOUR MAYCO PUMP WILL NOT DAMAGE THE BEARING.
Clearing the System After Mix Set-Up

If for any reason the mix should set up in the system, the following procedure is suggested:

1. Disconnect the hose from the pump and wash the pump out immediately.

2. Reconnect the hose and fill the hopper with water.

3. **DO NOT** try to push all the concrete out of all of the hose lines at one time.

   Example: If you had 200 feet of system out, you would disconnect each hose. Clean it out by pushing water through the first hose connected to the pump, then continue progressing through all the hoses, until the entire system is clean.

4. If waiting time is excessive, it would be wise to wash out the pump and hoses and start over when the new truck arrives. This can be avoided by being observant to the pump and system, also taking into consideration the above factors (A through D) affecting the mix.

Clearing Concrete Blockage

**NOTICE**

If you repeatedly pull the throttle all the way out and try to force the pump to push through blockages due to separation of material in the hose or manifold, you will soon have breakdowns and costly repairs which are not covered under warranty.

If a blockage occurs, find where it is and clear it before further pumping. **DO NOT** increase the engine speed to clear the blockage. Increasing the engine speed will only compound the problem.

If a blockage occurs in a hose, walk the hose until you find the point of trouble. The hose will be soft immediately past the blockage. To clear the blockage:

1. Disconnect the hose at the first coupling past the blockage. Be careful when disconnecting the hose. The hose is under pressure and could whip and cause severe bodily harm.

2. Elevate the hose at that point with the blockage area hanging down.

3. Using a hammer, you can pound the downstream edge of the packed area until it is free to flow. Shake all of the sand and gravel out to the end of the hose.

4. Before reconnecting the hose, start the pump and run a small amount of concrete out to the end of the hose. This will ensure that all of the separation is out of the hose.

Clearing Shuttle Tube Blockage

The shuttle tube is blocked if volume at the discharge end of the hose stops and the hydraulic oil pressure gauge reads 4,400 psi or more.

Great care must be taken when clearing a blockage in the shuttle tube, as a dangerous condition will exist from pressure buildup inside the shuttle tube. With the shuttle valve, the concrete can be pumped in reverse. Use the following procedures to clear the shuttle tubes.

**WARNING**

**Joint Clamps**

**DO NOT** open any of the delivery system joint clamps during operation. The clamps are under pressure. If the clamps are opened during operation, high pressure material could escape and cause severe bodily harm.
Reverse Pumping Procedure

1. Switch the pump into reverse. With pump speed at medium-slow (approx. 12 strokes per minute), try to pull the 'pack' back into the hopper with 5 or 6 reverse strokes.

2. Remix the concrete in the hopper.

3. Switch the pump into forward. If it is still blocked, repeat the reverse pumping procedure three times.

4. If the concrete still does not move, proceed to the Shuttle Tube Inspection Procedure.

Shuttle Tube Inspection Procedure

1. Stop the pump. Turn off the engine.

2. The senior or most experienced operator must warn all others to stand at least 20 feet away from the machine and turn their heads to face away from the pump.

3. The operator will position himself beside the reducing elbow at the pump outlet. While wearing safety glasses, slip the end of a pry bar (24-inch length of reinforcing steel rod) under the latch of the hose clamp and flip it up.

4. Carefully knock the end of the hose away from the reducer.

5. Chip the concrete out of the reducer with the pry bar.

6. Remove the reducer. From the discharge end, chip the concrete out of the shuttle tube with the pry bar. If concrete cannot be loosened from the outlet of the shuttle tube, remove the clean-out plug on the bottom of the hopper to discharge the concrete.

7. Chip the blockage out with the pry bar.

8. Flush the shuttle tube with water.

9. Before resuming operation of the pump, perform the Reverse Pumping Procedure to relieve pressure on the shuttle tubes.

The following is a brief explanation of how the concrete cylinders, hydraulic cylinders, shuttle tube, valves and hopper work in sequence to pump concrete.

The hydraulic pressure is generated by a variable-volume, pressure-compensated, axial piston pump that is driven by a diesel engine. The rod sides of the drive cylinders are hydraulically connected together creating a 'slave circuit' which allows hydraulic oil to transfer from one piston to the other.

The two part cycling sequence is initiated by an electrical signal generated by two proximity switches activated by the drive cylinder. The proximity switches are normally open, magnetically sensing the movement of the main drive cylinder. As the drive cylinder piston head passes the proximity switch, an electrical signal is sent to the solenoid-operated pilot valve which in turn directs pilot oil to the four valves controlling the drive cylinder and the shuttle cylinder.

A one-gallon accumulator assists the movement of the shuttle tube. This circuit assures that the shuttle tube will throw with the same intensity of each stroke regardless of how fast the main drive cylinders are cycling.

8. Flush the shuttle tube with water.

9. Before resuming operation of the pump, perform the Reverse Pumping Procedure to relieve pressure on the shuttle tubes.

The following is a brief explanation of how the concrete cylinders, hydraulic cylinders, shuttle tube, valves and hopper work in sequence to pump concrete.

The hydraulic pressure is generated by a variable-volume, pressure-compensated, axial piston pump that is driven by a diesel engine. The rod sides of the drive cylinders are hydraulically connected together creating a 'slave circuit' which allows hydraulic oil to transfer from one piston to the other.

The two part cycling sequence is initiated by an electrical signal generated by two proximity switches activated by the drive cylinder. The proximity switches are normally open, magnetically sensing the movement of the main drive cylinder. As the drive cylinder piston head passes the proximity switch, an electrical signal is sent to the solenoid-operated pilot valve which in turn directs pilot oil to the four valves controlling the drive cylinder and the shuttle cylinder.

A one-gallon accumulator assists the movement of the shuttle tube. This circuit assures that the shuttle tube will throw with the same intensity of each stroke regardless of how fast the main drive cylinders are cycling.

GENERAL INFORMATION

The following is a brief explanation of how the concrete cylinders, hydraulic cylinders, shuttle tube, valves and hopper work in sequence to pump concrete.

The hydraulic pressure is generated by a variable-volume, pressure-compensated, axial piston pump that is driven by a diesel engine. The rod sides of the drive cylinders are hydraulically connected together creating a 'slave circuit' which allows hydraulic oil to transfer from one piston to the other.

The two part cycling sequence is initiated by an electrical signal generated by two proximity switches activated by the drive cylinder. The proximity switches are normally open, magnetically sensing the movement of the main drive cylinder. As the drive cylinder piston head passes the proximity switch, an electrical signal is sent to the solenoid-operated pilot valve which in turn directs pilot oil to the four valves controlling the drive cylinder and the shuttle cylinder.

A one-gallon accumulator assists the movement of the shuttle tube. This circuit assures that the shuttle tube will throw with the same intensity of each stroke regardless of how fast the main drive cylinders are cycling.
In the first cycle (Figure 3), hydraulic pressure is applied to cylinder (B) causing the hydraulic piston, which is connected to the concrete piston and piston cup, to discharge concrete into the delivery line.

As one cylinder is discharging concrete, the hydraulic oil from the rod side (B) of the drive cylinders is being transferred through the slave circuit, causing the opposite cylinder (A) to move back on the suction stroke, filling the cylinder with concrete.

The shuttle tube is sequenced to pivot to each concrete cylinder as the drive cylinders stroke to push concrete.

As the second cycling sequence begins (Figure 4), the shuttle tube pivots to the opposite cylinder (A).

The hydraulic piston passes under the proximity switch and sends pressure to the piston, causing it to stroke and discharge concrete into the delivery line. Hydraulic oil is transferred through the slave circuit to cylinder (B), causing it to start a suction stroke, refilling it with concrete. The pumping sequence then repeats for the duration of the operation.
Figure 5. Pump Components
Figure 5 and Figure 6 illustrate the locations of the major components for the LS450 concrete pump. The function of each component is described below:

1. **Tow Hitch Coupler** — Requires a 2-inch ball hitch or a 3-inch pintle. Capable of towing up to 8,000 pounds.

2. **Radio Control Antenna** — Mounting location for radio control antenna. Works in conjunction with handheld radio remote (option).

3. **Manifold Access Door** — Release the latch and lift the door to access the hydraulic manifold block.

4. **Hydraulic Oil Tank/Cap** — Remove the cap to add hydraulic fluid. Fill with Shell Oil Tellus 46 or equivalent.

5. **Hydraulic Oil Filter** — This in-tank return hydraulic filter with a 10-micron, cleanable filter is designed to remove all particles large enough to cause wear and job breakdown. Under normal conditions, replace every 6 months.

6. **Hydraulic Oil Reservoir Access Covers** — Remove these covers to gain access to the hydraulic oil tank for maintenance and cleaning.

7. **Hopper/Hood** — Lift the hood to fill. Concrete from a ready-mix truck is poured into this hopper. The hopper can hold 10 cubic feet of concrete with optional forward/reverse mixer. **NEVER** put hands or any other parts of your body into the hopper.

8. **Shuttle Cylinder/Guard** — Under pressure, the shuttle cylinder shears concrete passing from the concrete cylinder to the delivery line during the cycle phase. **ALWAYS** keep hands clear of the shuttle cylinder during operation.

9. **Rear Pumping Jack Stand** — Use this jack stand to level and support the rear end of the pump during operation. **NEVER** deploy on unlevel ground and **ALWAYS** check for firmness of ground.

10. **Tires** — This trailer uses two ST235/80R16 type tires. Tire inflation pressure is the most important factor for tire life. Pressure should be checked to 80 psi cold before operation. **DO NOT** bleed air from the tires when they are hot. Check inflation pressure weekly during use to ensure maximum tire life and tread wear.

11. **Fuel Tank/Cap** — Fill with diesel fuel. Fuel tank (cell) holds approximately 40 gallons (176 liters). **DO NOT** top off fuel. Wipe up any spilled fuel immediately.

12. **Battery** — This unit uses a +12 VDC type battery. **ALWAYS** use gloves and eye protection when handling the battery.

13. **Fuel Tank (Cell) Access Cover** — Remove this cover to gain access to the fuel tank for maintenance and cleaning.

14. **Parking Jack Stand** — Use this jack stand to level and support the tow end of the pump.

15. **Front Pumping Jack Stand** — Use this jack stand to level and support the rear end of the pump during operation. **NEVER** deploy on unlevel ground and **ALWAYS** check for firmness of ground.

16. **Safety Chains** — This pump uses 5/16-inch-thick, 72-inch-long, zinc-plated safety chains. **ALWAYS** connect safety chains when towing.
OPTION: HYDRAULIC STABILIZER

Figure 6. Pump Components (Continued)
17. **Hydraulic Oil Sight Glass** — Use to determine the amount of hydraulic oil remaining in the tank. The sight glass also contains a temperature gauge for monitoring the temperature of the hydraulic oil.

18. **Control Box** — Contains the electrical components required to run the pump. See the *Components (Digital Control Panel)* section for component callouts.

19. **Hydraulic Manifold Block** — Manifold block that controls the flow of hydraulic pressure to the components required to control the pump.

20. **Engine** — Hatz Turbo Diesel 4H50 engine. See *Components (Engine)* for more details.

21. **Radiator** — Fill only with recommended coolant. Radiator coolant capacity is approx. 3.4 gallons (13 liters).

22. **Rear Running Lights** — **ALWAYS** make sure both the right and left running lights are functioning correctly before towing the pump.

23. **Hopper Discharge Sleeve** — Connect hoses or steel pipes to the discharge sleeve for pouring concrete.

24. **Hydraulic Pump** — This unit incorporates an axial variable displacement hydraulic piston pump.

25. **Volume Control** — This device is electronically controlled by the cylinder stroke switch located on the front panel of the control box. The function of the volume control is to set the pumping stroke.

26. **Lubrication Box** — This box is empty when shipped from the factory. Please fill with 5.5 gallons (20.7 liters) of SAE 30 motor oil for first-time use. Also check the dual clean-out point on the bottom of the lubrication box for a secure, tight fit.

27. **Heat Exchanger** — The function of the heat exchanger is to cool the hydraulic oil when pumping in high-temperature weather conditions. The exchanger draws oil from the hydraulic tank through a filter and into the heat exchanger before allowing it to flow into the hydraulic system.

28. **Accumulator** — Stores hydraulic oil under pressure and releases it to the shuttle cylinder. Provides the pressure needed to ensure enough force is provided during cycle.

29. **Documentation Box** — Contains engine and pump operation, parts and maintenance information.

30. **Remixer Motor** — Drives the remixer paddles inside the hopper. The motor direction is controlled by the remixer control lever.

31. **Hydraulic Stabilizer Control Lever (Right)** — This feature is an **option**. Push the lever downward to extend the left hydraulic stabilizer. Push the control lever upward to retract the stabilizer.

32. **Hydraulic Stabilizer Control Lever (Center)** — This feature is an **option**. Push the lever downward to extend the right hydraulic stabilizer. Push the control lever upward to retract the stabilizer.

33. **Remixer Control Lever** — Controls the forward/reverse motion of the hopper remixer paddles.

34. **Hydraulic Stabilizer (Optional)** — This feature is an **option**. Heavy-duty left- and right-side hydraulic stabilizers reinforce existing rear jack stands for improved pump stability.
COMPONENTS (DIGITAL CONTROL PANEL)

Figure 7. Digital Control Panel Components
COMPONENTS (DIGITAL CONTROL PANEL)

Figure 7 illustrates the digital control panel components. A brief description of each component is described below.

1. **Emergency Stop Button** — Press the emergency stop button to stop the pump in an emergency. Turn the knob counterclockwise to disengage the stop button.

2. **Ignition Switch** — Insert the ignition key here to start the engine. Turn the key clockwise to the ON position, then continue turning clockwise to the START position and release. To stop the engine turn the key fully counterclockwise to the STOP position.

3. **Pumping Control Switch** — This 3-position switch controls the pumping of the pump. The rightmost position (REMOTE) is for use with the remote control unit, the leftmost position (LOCAL) is for normal pumping operation, and the centermost position (CENTER OFF) prevents pumping.

4. **Remote Cable Receptacle** — Insert the remote control cable into this receptacle.

5. **Manual Cylinder Jogging Switch** — This 2-position switch allows the operator to manually jog the cylinders to assist in clearing material line packs and is used to test pumping pressure. See Pressure Test in the Maintenance section of this manual for the testing procedure.

   The leftmost position jogs cylinder ‘A’ and the rightmost position jogs cylinder ‘B.’

6. **Cylinder Stroke Control Switch** — This 2-position switch controls the pumping function. The leftmost position (AUTOMATIC) sets the pump to automatic cycling. Set the switch to this position for normal pump operation.

   The rightmost position (JOG) changes the pump from automatic to manual cycling. This allows the cylinders to be manually cycled using the manual cylinder jogging switch.

7. **Vibrator Cable Receptacle (Option)** — Insert the vibrator cable into this receptacle.

8. **Direction Control Switch** — This 2-position switch controls the direction of flow for any mix in the pump. The leftmost position sets the pumping direction to forward and the rightmost position sets the pumping direction to reverse.

9. **Stroke Volume Control Switch** — Increases or decreases the number of pump strokes per minute.

10. **Scroll Switch** — Allows the operator to scroll the various readout screens.

11. **Reset Switch** — Allows the operator to reset the stroke counter.

12. **Digital Readout Screen** — Displays and monitors the various functions of the machine.

13. **Accumulator Pressure Gauge** — This gauge monitors the internal pressure of the accumulator tank. Normal internal pressure should read approximately 1,750 psi during pumping.

14. **Main Pressure Gauge** — This gauge monitors the system pressure while pumping material. The maximum pressure rating is 4,400 psi.
COMPONENTS (DIGITAL CONTROL PANEL)

PRIMARY SCREEN

Screen 1
Indicates the various modes of the switch settings. Monitors engine RPM—Idle speed 900, High speed 2,400. Battery charge indicator—Normal charge 13+ volts. Indicates electrical malfunction—Refer to Troubleshooting section.

SECONDARY SCREENS

Screen 2
Displays the position of the VOLUME CONTROL switch by indicating whether the increase or decrease position is on or off.

Screen 3
Displays the number of hours the engine and pump have been used and the number of faults the pump has registered. All three indicators can be reset to zero by the RESET switch on the control panel.

Screen 4
Displays the number of strokes the main hydraulic cylinders have gone through. This indicator can be reset to zero by the RESET switch on the control panel.

Screen 5
Displays the ON/OFF electrical signal status for the Proximity Switch A, Proximity Switch B, Engine Fuel Solenoid, and Unloader Solenoid.

Screen 6
Displays the number of times the main hydraulic cylinders stroke and the yards per hour output. This indicator can be reset to zero by the RESET switch on the control panel.

Screen 7
Displays the electrical status of the engine fuel solenoid. To test the 12-volt solenoid status, activate with the RESET switch on the control panel.

Screen 8
Displays the communication status of the (optional) radio remote control. To activate a new remote control connection, use the RESET switch on the control panel.

Screen 9
Displays engine fault codes (SPN/FMI).
Figure 8. Hatz 4H50 Diesel Engine Components

The engine (Figure 8) must be checked for proper lubrication and filled with fuel prior to operation. Refer to the manufacturer's engine manual for instructions and details of operation and servicing.

1. **Intake Opening** — Captures air needed for internal combustion.

2. **Rain Cap** — Prevents precipitation and foreign objects from entering the exhaust system.

3. **Air Filter (Optional)** — Helps provide clean source of air flow to the engine.

4. **Dust Discharge Valve** — Prevents larger particles of dust and debris from being drawn back into the air cleaner and discharges dust and debris to the outside.

5. **Lifting Eyes** — Located on either side of the engine. Used when the engine must be lifted for service.

6. **Fan** — Draws air through the radiator to cool the engine.

7. **Oil Filter** — Spin-on type, filters out oil contaminants.

8. **Fuel Fine Filter** — Protects the lift pump and diesel injection systems by cleaning fuel of smaller, harmful contaminants and water not captured by the filtration system.

9. **Oil Drain Bolt** — Remove this bolt to drain the crankcase of engine oil.

10. **Starter** — Starts the engine when the ignition key is rotated to the **START** position.

11. **Electric Fuel Pump** — Pumps fuel to the fuel system.

12. **Fuel Prefilter Drain Plug** — Retains dirty fuel inside the filter until the fuel prefilter is ready to be changed. Also acts as the water-in-fuel sensor.

13. **Fuel Prefilter** — Protects the lift pump and diesel injection systems by separating and cleaning fuel of any harmful contaminants and water. Filters fluids before further filtration by the fuel fine filter.

14. **Engine Nameplate** — Identifies engine make, model, serial numbers, and other pertinent information.

15. **Dipstick** — Remove to check the amount and condition of oil in the crankcase.

16. **Oil Filler Plug (Lower)** — Remove this plug to add fresh oil to the crankcase. Fill with the recommended type oil as specified in the **Maintenance** section of this manual.

17. **Crankcase Ventilation** — One-way passage for gases to escape in a controlled manner from the engine crankcase.
BEFORE STARTING

1. Read the safety instructions at the beginning of this manual.

2. Clean the entire pump, removing dirt and dust—particularly the engine cooling air inlet and heat exchanger.

3. Check the air filter for dirt and dust. Replace the air filter if it is excessively dirty.

4. Check fastening nuts and bolts for tightness.

FUEL SAFETY

**WARNING**

NEVER operate the pump in a confined area or enclosed area structure that does not provide ample free flow of air.

ALWAYS wear approved eye and hearing protection when operating the pump.

NEVER operate the engine with the engine hood removed. The possibility exists of hands, long hair, or clothing becoming entangled with the V-belt, causing injury and bodily harm.

NEVER place hands or feet inside the hopper. ALWAYS shut down the engine before performing any kind of maintenance service on the pump.

**DANGER**

Handle fuel safely. Motor fuels are highly flammable and can be dangerous if mishandled. NEVER smoke while refueling. NEVER attempt to refuel the pump when the engine is hot or running.

**DANGER**

Diesel fuel is extremely flammable and its vapors can cause an explosion if ignited. NEVER start the engine near spilled fuel or combustible fluids. NEVER fill the fuel tank while the engine is running or hot.

DO NOT overfill the tank, as spilled fuel can ignite if it comes into contact with hot engine parts or sparks from the ignition system. Store fuel in approved containers, in well-ventilated areas, away from sparks and flames. NEVER use fuel as a cleaning agent.

FUEL CHECK

1. Check the fuel gauge (Figure 9) built into the fuel tank cap to determine if the pump's engine fuel is low.

**NOTICE**

Refer to Figure 5–Figure 8 for the location of any control or component mentioned in this section.

---

Figure 9. Fuel Cap Gauge
2. If fuel is low, remove the fuel filler cap and fill the tank with #2 diesel fuel (Figure 10).

5. If the oil level is close to the 'min.' mark, add engine oil through the oil filler hole up to the 'max.' mark. Depending on accessibility, use either the upper oil filler hole (Figure 12) or the lower filler hole (Figure 13).

**ENGINE OIL CHECK**

1. Make sure the pump/engine is on level ground.
2. Pull the engine oil dipstick from its holder and wipe it clean.
3. Reinsert the dipstick.
4. Pull out the dipstick and check the oil level (Figure 11).
6. The oil listed in Table 4 is recommended to ensure better engine performance.

**HYDRAULIC OIL CHECK**

1. Determine if the hydraulic oil level is low by observing the level of the oil in the hydraulic oil sight glass (Figure 14).

2. If the hydraulic oil level is low, remove the hydraulic oil tank cap (Figure 15) just above the hydraulic oil sight glass and add the correct amount of hydraulic oil to bring the hydraulic oil to a normal, safe operating level. Use Shell Tellus® 46 hydraulic oil.

3. Check the oil level in the lubrication box (Figure 16). If low, fill with up to 5.5 gallons of SAE #30 motor oil. The oil level must be checked daily. The lubrication box should be serviced as described in the maintenance section.

**Figure 14. Hydraulic Oil Sight Glass**

**Figure 15. Adding Hydraulic Oil (Filler Hole)**

**Figure 16. Filling the Lubrication Box**
LOCATION OF PUMP

1. Place the pump in the best location on the site to pump concrete efficiently.

2. Lay down the hose in the shortest distance possible.

Rear Stabilizer Jacks

**WARNING**

NEVER place feet under jacks while operating.

ALWAYS retract rear stabilizer jacks prior to towing.

ALWAYS retract rear stabilizer jacks prior to servicing to relieve load (working pressure).

To reduce excessive vibration and rocking of the pump, set the rear stabilizers as follows:

1. Locate both the left and right rear stabilizer jacks (Figure 17).

   ![Figure 17. Locating Rear Stabilizer Jacks](image)

2. Remove the cotter pin (Figure 18) from the handle T-bolt eye, then pull the handle T-bolt to release the stabilizer jack.

   ![Figure 18. Rear Stabilizer Jack](image)

3. Position both rear stabilizer jacks on firm (not loose), level ground (Figure 19).

   ![Figure 19. Rear Stabilizer Jack Stand Deployment](image)

   INCORRECT

   CORRECT

Hydraulic Rear Stabilizer Jacks (Optional)

If your pump comes equipped with hydraulic rear stabilizers (Figure 20), they can be controlled as follows:

1. Push down the middle control lever to extend the right hydraulic rear stabilizer.

   ![Figure 20. Control Levers for Hydraulic Rear Stabilizers](image)

2. Push up the middle control lever to retract the right hydraulic rear stabilizer.

3. Push down the rightmost control lever to extend the left hydraulic rear stabilizer.

4. Push up the rightmost control lever to retract the left hydraulic rear stabilizer.
STARTING PROCEDURE

**WARNING**

DO NOT attempt to operate this concrete pump until the Safety Information, General Information, and Inspection sections have been read and understood.

1. Locate the emergency stop switch (Figure 21) on the digital control panel. Turn the emergency stop switch clockwise and release (open). This will allow the engine to start.

![Figure 21. Emergency Stop Switch](image)

2. Place the cylinder stroke control switch in the AUTOMATIC position (Figure 22).

![Figure 22. Cylinder Stroke Control Switch (Automatic)](image)

3. Place the pumping control switch in the CENTER OFF position (Figure 23) for normal pumping operation.

![Figure 23. Pumping Control Switch (OFF)](image)

4. Place the direction control switch in the FORWARD position (Figure 24).

![Figure 24. Direction Control Switch (FORWARD)](image)

5. To start the engine, insert the ignition key (Figure 25) into the ignition switch and turn the key to the ON position.

![Figure 25. Ignition Switch](image)

6. When the ignition key is in the ON position, the digital readout screen (primary) will cycle through 3 displays as shown in Figure 26.

![Figure 26. Primary Screen (Ignition Key ON)](image)

7. Turn the key to the START position and listen for the engine to start. In warm weather, let the engine warm up for 5 minutes. In cold weather, let the engine warm up for 10 minutes.
HOSE LUBRICATION

Before pumping, it is necessary to lubricate the hose. This procedure prevents separation and blockages in the hose. Inspect the lines at all times to prevent problems.

Before concrete is discharged into the hopper, it is suggested that 3 to 4 gallons of water be sprayed into the hopper, followed by approximately 5 gallons of a creamy cement and water slurry (1/2 bag of cement to 5 gallons of water).

NOTICE

Getting the concrete to flow through the hose at the start of the pumping cycle can be one of the most critical operations of the pour.

Priming the Pump with Slurry Mixture

It is CRITICAL to the successful operation of a concrete pump that the manifold and all delivery hoses, pipes and elbows are coated with a film of lubrication BEFORE you attempt to pump concrete.

Failure to properly prepare the pump and system will result in a ‘dry pack’ of concrete, blocking the shuttle valve tube or delivery line.

1. Connect the entire delivery system to the pump. Pour 5 gallons of water and a bag of raw cement into the hopper.
2. Place the direction control switch in the REVERSE position (Figure 27). This will mix the water and cement into slurry.

Figure 27. Direction Control Switch (REVERSE)

3. Mix the slurry to the consistency of a smooth batter.
4. Position the first ready-mix truck at the hopper. Check the concrete. DO NOT discharge concrete into the hopper at this time.

5. Place the direction control switch in the FORWARD position. This will start the flow of the slurry to the hoses.
6. Keep the slurry flowing until most of it is pumped out. However, make sure that some slurry is left on the hopper when concrete is first discharged from the ready-mix truck.

PUMPING

WARNING

Safety glasses and hearing protection MUST be worn at all times when operating the pump. Failure to follow safety guidelines can result in serious injury.

NOTICE

A well-planned location of the pump and routing of the hose before starting a pour may prevent subsequent moves throughout the job.

1. Place the pumping control switch in the LOCAL position (Figure 28) for normal pumping operation.

Figure 28. Pumping Control Switch (Local)

2. Holding the volume control switch (Figure 29) to the right will increase pumping volume to approximately 10 strokes per minute. Holding the volume control switch to the left will decrease pumping volume.

Figure 29. Volume Control Switch

3. A thumping sound (cylinder stroke) should be heard. The thumping sound represents the number of strokes per minute (volume) of the pump.
4. Scroll through the **digital readout screen** with the scroll switch to go to screen 7 (Figure 30). This screen will show the volume in strokes per minute.

![THROTTLE ON](image)

**Figure 30. Strokes Per Minute Display**

5. Let the pump cycle until the hydraulic oil temperature (Figure 31) is approximately 50–60°F (10–16°C).

![HYDRAULIC OIL TEMPERATURE](image)

**Figure 31. Hydraulic Oil Temperature Gauge**

6. The **accumulator pressure gauge** (Figure 32) should read approximately 1,750 psi (pounds per square inch).

![ACCUMULATOR PRESSURE](image)

**Figure 32. Accumulator Pressure Gauge**

7. Push the **hopper remixer control lever** downward (Figure 33). The hopper remixer control lever is located to the left of the hydraulic temperature gauge.

![HOPPER REMIXER CONTROL LEVER](image)

**Figure 33. Hopper Remixer Control Lever**

8. Observe that the blades (Figure 34) inside the hopper are rotating in a clockwise (forward) direction. To make the blades rotate in a counterclockwise (reverse) direction, push the hopper remixer control lever (Figure 33) **upward**.

![HOPPER REMIXER BLADES (ROTATION)](image)

**Figure 34. Hopper Remixer Blades (Rotation)**

9. Place the volume control switch (Figure 28) in the increase volume position (right) to increase the volume to 25–30 strokes per minute. Slowly discharge the concrete from the ready-mix truck into the hopper and completely fill it. Keep the pump running continuously until concrete is discharging at the end of the delivery system. If the pump is stopped during this procedure, a blockage may occur.

!! **CAUTION**

**HOSE/LINE BLOCKAGE**

If hoses or lines are blocked for any reason, or if the lines are kinked when starting up or during the pumping cycle, the pump pressure could straighten out the kink or force out the blockage. This rapid surge of material could cause the lines to whip or move in a manner that could cause injury to personnel.
10. It is important that once the slurry procedure is completed, and concrete is flowing through the hose, **DO NOT** stop the pour until all the slurry is pumped out and the concrete has reached the end of the hose. The only reason to stop the pump during the priming procedure is if a blockage occurs.

11. If it is necessary to replace or add a section of delivery system, after the initial lubrication procedure, wet the inside area of the hose, pipe or elbow with 5 gallons of water per 25-foot length, before adding it to the system.

**NOTICE**

When pumping long distances or pumping stiff mixes, expect a drop in volume compared to shorter lines or wetter mixes due to the change in valve efficiency or cavitation.

**REMOTE CONTROL (OPTIONAL)**

The LS450 concrete pump has a remote control feature that allows the pump to be remotely controlled. If desired, the pump can be operated via a receiver/transmitter (radio) or a hardwire method, which utilizes a 25-foot extension cable. Contact the MQ Sales Department to order a remote control.

**Radio Remote Control**

**Installation of the Radio Remote Control Assembly**

1. Remove the two screws (Figure 35) on the digital control panel that secure the front panel to the control box.

2. Tilt and slowly pull out the control panel and place it on top (Figure 36) of the control box to gain access to the inside of the box.

3. Install the wireless remote module (Figure 37) with the 2 screws and nuts provided inside the control panel. Connect the 3-wire connector from the wireless remote module to the electronic control unit.

4. Reinstall the control panel and tighten the 2 retaining screws.
5. On the top of the unit, to the right of the control box (Figure 38), hammer out the knock-out hole and install the remote antenna.

![Antenna Installation](image)

**Figure 38. Antenna Installation**

6. Connect the antenna cable to the connector (Figure 38) on the rear of the control box.

**Radio Remote Control Operation**

Before the remote control hand-held module can be used, the *pumping control switch* on the control box must be placed in the *REMOTE* position (Figure 39).

![Pumping Control Switch](image)

**Figure 39. Pumping Control Switch (Remote)**

Remote pumping operation can be performed using the hand-held radio remote control (Figure 40).

![Radio Remote Control](image)

**Figure 40. Radio Remote Control**

The buttons on the hand-held remote control module have the following functions:

- **ON/OFF** — Turns the power on or off. When power is on the power LED lights red. If the battery LED turns red, the 9-volt battery needs to be replaced.
- **E-STOP** — Turns off the pump completely in an emergency.
- **PUMP ON/OFF** — Starts and stops the forward pumping.
- **PUMP REV** — Momentarily pumps in reverse direction.
- **VOLUME (+)** — Increases the pumping volume.
- **VOLUME (−)** — Decreases the pumping volume.

**Radio Remote Control Programming**

Before starting operation of the hand-held *radio remote control*, go to Screen 9 of the *digital readout screen*:

**Screen 9**

![Screen 9](image)
1. Press the **ON/OFF** button on the radio (wireless) remote control to turn on the power. Hold the **RESET** switch up. The display will now show:

   **Screen 9**

   ![Screen 9](image)

2. After 5 seconds, the display will show:

   **Screen 9**

   ![Screen 9](image)

3. The hand-held remote control module is now ready for use.

   **Remote Control Cable Operation (25 Feet)**

   The remote control cable (Figure 41) has the following controls:

   - **Pump ON/OFF** — Starts and stops forward pumping.
   - **Pump REV** — Starts pumping in reverse direction.

   ![Figure 41. Remote Control Cable](image)

   Before the remote control cable can be used, the pumping volume rate must be set.

   1. Start the pump as outlined in the *Operation* section of this manual.
   2. Place the **pumping control switch** in the **LOCAL** position.
   3. Using the momentary volume control switch, adjust the pumping rate (volume) to the desired strokes per minute.
   4. Once the desired pumping rate has been achieved, place the **pumping control switch** in the **REMOTE** position.

   Connect the **remote control cable** (Figure 41) to the receptacle labeled **remote** located on front of the digital panel.

</tbody>
</table>

1. Replace engine oil and filter at 100 hours, first time only.
2. Add ‘Supplemental Coolant Additives’ (SCAs) to recharge the engine coolant.
3. Replace primary air filter element when restriction indicator shows a vacuum of 625 mm (25 in.) H20.
4. If blowby hose needs to be replaced, ensure that the slope of the blowby hose is at least 1/2 inch per foot, with no sags or dips that could collect moisture and/or oil.
GENERAL INSPECTION

Prior to each use, the pump should be cleaned and inspected for deficiencies. Check for loose, missing or damaged nuts, bolts or other fasteners. Also check for fuel, oil, and coolant leaks. Use Table 5 as a general maintenance guideline. For detailed engine maintenance refer to the Hatz engine owner’s manual.

**CAUTION**

Certain maintenance operations or machine adjustments require specialized knowledge and skill. Attempting to perform maintenance operations or adjustments without the proper knowledge, skills or training could result in equipment damage or injury to personnel. If in doubt, consult your dealer.

**WARNING**

Accidental starts can cause severe injury or DEATH.

ALWAYS place the ON/OFF switch in the OFF position.

Disconnect and ground spark plug leads and disconnect the negative battery cable from the battery before servicing.

**WARNING**

Some maintenance operations may require the engine to be running. Ensure that the maintenance area is well ventilated. Exhaust contains poisonous carbon monoxide gas that can cause unconsciousness and may result in DEATH.

**CAUTION**

ALWAYS allow the engine to cool before servicing. NEVER attempt any maintenance work on a hot engine.

Air Cleaner (250 Hours)

The Hatz diesel engine is equipped with a replaceable, high-density paper air cleaner element (Figure 42). This air cleaner may have an inner element (option) that is used as a backup filter should the main element become damaged.

Check the air cleaner daily or before starting the engine.

**NOTICE**

Operating the engine with loose or damaged air cleaner components could allow unfiltered air into the engine causing premature wear and failure.

**Figure 42. Air Cleaner**

1. Release the latches located on either side of the air cleaner dust pan and remove the dust pan.
2. Remove the air cleaner element.
3. Check for and correct heavy buildup of dirt and debris along with loose or damaged components.
4. To clean the main element (paper air filter), tap the filter element several times on a hard surface to remove dirt, or blow compressed air—not to exceed 30 psi (207 kPa, 2.1 kgf/cm$^2$)—through the filter element from the inside out. See Figure 43.

Figure 43. Cleaning Paper Air Filter Element

**CAUTION**

Wear protective equipment such as approved safety glasses or face shields and dust masks or respirators when cleaning air filters with compressed air.

**NOTICE**

DO NOT use excessive air pressure or the paper air filter element will become damaged and will need to be replaced.

5. Replace the element if it is damaged or excessively dirty.

6. Clean the inside of the dust pan.

7. Reinstall the element or, if equipped, the precleaner over the paper air cleaner element.

8. Reinstall the air cleaner dust pan and secure the latches.

**NOTICE**

NEVER run the engine with the air cleaner removed or without an element.

Checking Engine Oil (Daily)

1. When checking or adding oil, place the machine so the engine is level.

2. Pull the engine oil dipstick (Figure 44) from its holder and wipe it clean.

Figure 44. Checking Engine Oil Level

3. Reinsert the dipstick.

4. Pull out the dipstick and check the oil level. The oil should be between the ‘min.’ mark and the ‘max.’ mark (Figure 44) on the dipstick.

5. If the oil level is low, add the correct amount of engine oil to bring it to a normal, safe level. See Table 6 for recommended oil viscosity.

6. Allow enough time for any added oil to make its way to the oil pan before rechecking the level.

Table 6. Oil Selection Chart
Changing Engine Oil and Filter

Change the engine oil and filter after the first 50 hours of use, then every 6 months or 250 hours. Refer to Table 6 for recommended oil viscosity.

**NOTICE**

ALWAYS drain the engine oil while the oil is warm.

1. Prepare a waste oil container to drain the oil into.
2. Remove the oil filler cap while draining the engine to allow the oil to drain easily.
3. Remove either the side or front oil drain bolt (Figure 45) to drain the oil into the container.
4. After the oil is sufficiently drained, reinstall and securely tighten the oil drain bolt.
5. Using a filter wrench, turn the oil filter (Figure 46) counterclockwise to remove.
6. Clean the sealing surface (Figure 47) on the engine where the oil filter mounts.
7. Lightly coat the gasket of the new oil filter with clean engine oil. Install the new filter first by hand until it contacts the engine sealing surface. Then tighten the filter another 3/4 turn using the filter wrench.
8. Fill the engine crankcase with high-quality detergent oil classified 'For Service CF, or CF-4.' Fill to the upper limit of the dipstick. DO NOT overfill. Crankcase oil capacity with oil filter replacement is approx. 1.85 gallons (7.0 liters).
9. Run the engine briefly for several minutes. Watch for oil leakage. Shut the engine down and allow it to sit for several minutes. Top off the oil to the upper limit on the dipstick.

**RADIATOR/COOLING SYSTEM**

Coolant (Antifreeze/Summer Coolant/Water)

Hatz recommends antifreeze/summer coolant for use in their engines, which can be purchased in concentrate (and mixed with 50% demineralized water) or pre-diluted. See the Hatz engine owner's manual for further details.

**WARNING**

When adding coolant/antifreeze mix to the radiator, DO NOT remove the radiator cap until the unit has completely cooled. The possibility of hot coolant exists which can cause severe burns.

Day-to-day addition of coolant is done via the radiator. When adding coolant to the radiator, DO NOT remove the radiator cap until the unit has completely cooled. Coolant capacity is approx. 3.4 gallons (13 liters).
MAINTENANCE

Operation in Freezing Weather

When operating in freezing weather, be certain the proper amount of antifreeze has been added. See Table 7.

Table 7. Antifreeze Operating Temperatures

Radiator Maintenance

1. Check the radiator for leaks that would indicate corrosion or damage.
2. Check the coolant level daily. Top off as necessary. Always use recommended coolant/antifreeze. Use the mixing ratios specified in Table 7 or by the coolant/antifreeze manufacturer. Replace coolant/antifreeze at least once a year.
3. Check radiator hoses for fatigue or cracking. Replace any defective hoses immediately.
4. Check the radiator cap seal and replace as necessary.
5. Blow off dirt and dust from the radiator and cooling fins with 28 psi (193 kPa) or less of compressed air (Figure 48). Be careful to not damage the fins with the compressed air.

FUEL PREFILTER

Replace the in-line fuel filter every 500 hours or 2 years.

1. Block the fuel feed line with a hose clip (Figure 49) between the fuel tank and fuel prefilter.
2. Place a suitable container under the filter to collect emerging fuel.
3. Disconnect the water level sensor cable (Figure 49) from the drain plug.
4. Release the drain screw and drain the fuel.
5. Unscrew the fuel prefilter. Fully unscrew the drain plug with integrated water level sensor.
6. Dispose of the used fuel prefilter according to local environmental regulations.
7. Clean the drain plug with integrated water level sensor and lightly oil the sealing surfaces. Screw the drain plug into the new fuel prefilter.
8. Lightly oil the gasket of the new fuel prefilter. Install the filter and tighten it by hand.
9. Release the fuel feed line and connect the water level sensor cable.

NOTICE

NEVER use high-pressure water or compressed air at greater than 28 psi (193 kPa), or a wire brush to clean the radiator fins. Radiator fins damage easily.

6. If there is a large amount of contamination on the fins, clean with detergent and rinse thoroughly with tap water.
Fuel Prefilter Water Separator

The fuel prefILTER is equipped with a water separator. An electronic water level sensor signals when the maximum permissible water level is reached inside the water separator. To drain the water separator, perform the following procedure:

1. Place a suitable container under the drain socket of the drain plug (Figure 50).

![Figure 50. Fuel Water Separator Filter](image)

2. Open the drain plug to drain water into the container.
3. As soon as fuel escapes, close the drain plug.
4. Dispose of the water/fuel mixture in an environmentally responsible manner.

FUEL FINE FILTER

Replace the fuel fine filter every 500 hours or every 2 years.

1. Block the fuel feed line using the hose clip (Figure 51).

![Figure 51. Fuel Fine Filter](image)

2. Place a suitable container under the filter to collect emerging fuel.
3. Unscrew the fuel fine filter with a strap wrench (Figure 51) and dispose of the filter according to local environmental regulations.
4. Lightly oil the gasket of the new fuel fine filter. Install the filter and tighten it by hand.
5. Release the fuel feed line.

OIL AND FUEL LINES

1. Check the oil and fuel lines and connections regularly for leaks or damage. Repair or replace as necessary.
2. Replace the oil and fuel lines every two years to maintain performance and flexibility.

V-BELT

Visually examine the V-belt (Figure 52) and determine if it is full of tiny cracks, frayed, has pieces of rubber missing, is peeling, or is otherwise damaged.

![Figure 52. V-Belt Inspection](image)

Also, examine the belt and determine if it is oil soaked or ‘glazed’ (a hard, shiny appearance on the sides of the belt). Either of these two conditions can cause the belt to run hot, which can weaken it and increase the possibility of it breaking.

Replace the V-belt immediately if it exhibits any of the above wear conditions.
**BATTERY MAINTENANCE**

**DANGER**
Use all safety precautions specified by the battery manufacturer when working with the battery.

**Flammable, explosive gas.** (Produces hydrogen gas while charging or during operation.) Keep the area around the battery well ventilated and keep away from any fire source.

Battery electrolyte contains corrosive, toxic chemical (dilute sulfuric acid). Avoid contact with eyes and skin.

**Shock or fire** due to electrical short circuit. Disconnect battery cables before inspecting the electrical system. **NEVER** ‘spark’ battery terminals to test for charge.

Mishandling of the battery shortens the service life of the battery and adds to maintenance cost. When handling the battery, do the following:

- Be careful to not let the battery electrolyte come in contact with your body or clothing.
- **ALWAYS** wear eye protection and rubber gloves, as the battery contains sulfuric acid which burns skin and eats through clothing.

**CAUTION**

Battery Safety

Wear safety glasses or face mask, protective clothing, and rubber gloves when working with the battery.

- Check the battery terminals periodically to ensure that they are in good condition.
- Use wire brush or sand paper to clean the battery terminals.
- **ALWAYS** check the battery for cracks or any other damage. If a white pattern appears inside the battery or paste has accumulated at the bottom, replace the battery.

**NEVER** attempt to charge a battery that is frozen. The battery can explode unless first allowed to thaw.

- If the pump will not be in operation for a long period of time, store it in a cool, dry place and check the battery charge level every month to maintain the performance of the battery.

- Check the battery regularly and make sure that the electrolyte level is to the bottom of the vent well (Figure 53). If necessary add only distilled water in a well-ventilated area. Never operate or recharge without sufficient fluid in the battery.

![Figure 53. Battery Electrolyte Levels](image)

**Figure 53. Battery Electrolyte Levels**
CLEANING THE PUMP AND DELIVERY SYSTEM

Cleaning the pump is a very important operation as it determines how the machine will pump the next time it is used.

1. Following the Clearing Concrete Blockage procedure in the General Information section of this manual, ensure that there is no blockage in the hose and line or in the shuttle tube. If a blockage exists, clear it.

2. Pump concrete until the opening of the concrete cylinder intake in the hopper is visible.

3. Stop the pump.

4. Carefully disconnect the first hose joint at the shuttle tube discharge elbow.

5. Add water to the hopper. Pump and flush clean the entire hopper, shuttle tube and discharge elbow with water.

6. Scoop out 12 inches of concrete from the inboard end of the delivery hose. Corkscrew a 6” × 6” × 8” sponge into the end of the first hose section. Reconnect the hose to the discharge elbow.

7. Fill the hopper with water. Pump until the sponge and clean water come out of the discharge end of the hose and line system.

8. When the pump has been used to pump aggregate concrete or mixes with high fines content (60% or more sand), there will be a tendency for hardened concrete to build up on the inside surface of the shuttle tube. Therefore, at the end of every such pour, after the pump and system have been cleaned and the engine shut off, remove all remaining concrete.

9. Use only a 2-1/2” diameter clean-out hook when back-pumping into a ready-mix truck. Use a safety chain to secure the clean-out hook to some solid part of the mixer truck to prevent the hook from jumping off of the drum. Run the pump at a maximum speed of 6 strokes per minute.

HYDRAULIC OIL SYSTEM MAINTENANCE

This Mayco pump is equipped with an in-tank return hydraulic filter with a 10-micron, cleanable filter. The element has been designed to remove all particles large enough to cause wear and job breakdown. Under normal conditions, we recommend replacement every 6 months.

The most important factor to keep in mind is the effect of cold weather on the hydraulic oil. The viscosity (thickness) of the hydraulic oil will be much heavier.

ALWAYS run the machine until the oil temperature reaches a minimum of 50°F (10°C) before pumping. Damage to the main piston pump will occur if the machine is cycled too fast before the oil temperature reaches the minimum of 50°F (10°C). Cycle the machine at 6–8 strokes per minute at approximately 1/3 throttle.
The hydraulic system is factory-filled with Shell Tellus 46 hydraulic oil, typically used in ambient temperature ranges of 39–90°F (4–32°C). The machine reservoir temperature range is 100–170°F (38–77°C).

If the machine is used in areas with ambient temperatures constantly above 90°F (32°C), the use of hydraulic fluid designated with an ISO rating of 68 is recommended. In areas with ambient temperatures constantly below 32°F (0°C), use oil with an ISO rating of 32.

**NOTICE**

DO NOT mix oil brands! This may impair quality.

**PUMP LUBRICATION**

The following components should be greased daily (or hourly if necessary). See Figure 54.

- Main hydraulic cylinders (2 grease fittings)
- Swing axle bushing (1 grease fitting)
- Shuttle cylinder (2 grease fittings top and bottom)
- Discharge nipple (3 grease fittings)
- Outriggers option (2 grease fittings)

![Diagram of lubrication points]

**NOTICE**

When lubricating the above components, use lithium-based EP, Texaco Multifak 20 or Lubriplate ED-2 type grease.
### Cylinder Lubrication Box

**Notice**

When using the pump during freezing conditions, completely drain the lubrication box and cover the hopper after pumping. Frozen liquid will restrict the piston travel and cause severe damage to the pump.

**Warning**

**ALWAYS** follow lockout/tagout procedures before checking the lubrication level. Stop the engine and remove the engine starter key. The possibility exists of severe bodily harm when hands are placed inside.

1. The lubrication level should be checked every day prior to pumping and maintained at a height of 5 inches, or about 1/2 the concrete cylinder height. We recommend using a 30-weight motor oil.

2. As the rubber piston cups naturally wear, fine cement particles will accumulate in the box. Once the concrete paste reaches a height of about 1/2 inch from the bottom of the box, drain and clean the lubrication box.

### Cleaning the Lubrication Box

1. Remove the top cover and the drain plug (Figure 55) located at the bottom of the box, and fully drain the inside of the box.

2. Once the box is drained, start the engine and stroke the cylinder (keeping hands out of the box) 10 to 15 times.

3. While stroking, spray water inside the box (Figure 55) to thoroughly clean out all contamination.

4. When the box is clean, replace the drain plug, add new lubrication and install the top cover.

### Accumulator Circuit

**Danger**

Improper accumulator charging can result in an explosion causing serious injury or death! **NEVER** use oxygen or compressed air to charge the accumulator! Only qualified personnel should perform this procedure. Use only dry nitrogen to charge the accumulator. Contact your Mayco service department or your local Hydac representative for proper charging procedure.

The accumulator circuit has two functions within the hydraulic system:

- The accumulator circuit furnishes the hydraulic pressure to cycle the shuttle tube.
- The accumulator circuit also furnishes the pilot pressure necessary to activate the hydraulic system.

The accumulator circuit is equipped with a bladder-type accumulator (Figure 56) pre-charged with 1,100 psi of dry nitrogen. The accumulator stores one gallon of hydraulic oil which is under 1,750 psi of pressure.

![Figure 56. Accumulator](image)

When the pump cycles, a portion of the stored oil is released to the shuttle cylinder. This released oil pressure ensures that the shuttle tube has enough force to shear the cylinder of concrete passing from the concrete cylinder to the concrete delivery line during the cycle phase.
Checking Accumulator Bladder Pressure

The normal accumulator pre-charge pressure should be approximately 1,100 psi. To check the accumulator pressure:

1. Start the engine and stroke the pump. The accumulator pressure gauge (Figure 57) should read 1,750 psi.

![Accumulator Pressure Gauge](Figure 57. Accumulator Pressure Gauge)

2. To determine the actual accumulator pressure, stop the engine and observe the pressure gauge. As the pressure reading slowly decreases, it will reach a point where there will be a sudden drop in the pressure. The pressure reading should be taken just prior to this sudden drop. If you do not read 1,100 psi, the accumulator may require charging or bladder replacement.

WEAR PLATE AND CUTTING RING

Due to the abrasive nature of concrete, it is normal for the cutting ring to wear on its sides as it shears through the concrete inside the hopper. The metal-to-metal friction and the abrasiveness of the concrete will cause extreme wear and reduced sealing capability between the cutting ring and wear plate.

If the two components do not properly seat against each other, slurry will pump into the hopper rather than out of the discharge line. See Figure 58. This condition can be easily observed:

- The level of concrete inside the hopper changes suddenly during each pumping stroke.
- Concrete slurry squirts into the air from the hopper (volcano effect).

![Wear Plate and Cutting Ring](Figure 58. Wear Plate and Cutting Ring)

It is important that the wear components be inspected weekly for proper sealing. Failure to inspect will eventually cause severe damage to the nun plate and material cylinders. Visually inspect the wear plate and cutting ring to ensure surfaces are sealed against each other.

If a deep groove or a wide space has developed on the sealing surfaces, it is time for replacement. Due to the motion of the shuttle tube, the cutting ring experiences a quicker rate of wear as opposed to the wear plate. The wear ring typically requires replacement two times per wear plate (2 to 1). When replacing the wear ring, also replace the rubber energizer ring.

Changing the Concrete Cylinder Piston Cups

The urethane piston cups will occasionally require replacement depending on the following factors:

- The fluid level and cleanliness of the lubrication box.
- The size and type of aggregate.
- The type of concrete being pumped.

It is time to replace the cups when increasingly large particles of sand and cement pass into the lubrication box.
DO NOT allow the cups to become so worn that they begin to pass lubrication into the material cylinders. If the liquid level of the lubrication box becomes too low, the rubber cups will severely deform due to excessive heat. When it is time for replacement, both cylinder cups should be replaced.

**Cylinder Cup Replacement Procedure**

1. Remove the two hydraulic hoses connected to the remix motor. Plug the ports with fittings (not provided) to prevent hydraulic hose leakage.

2. Remove the hopper discharge nipple and loosen the sleeve seal. Inspect and replace if wear is excessive.

3. Remove the two tie rod nuts and the four eyebolt nuts securing the hopper to the pump frame.

4. Using an approved lifting device, remove the hopper using extreme care to not damage the hopper seal.

5. Start the engine and turn on the pressure test switch. Cycle the pump in reverse until the hydraulic system obtains maximum pressure, then turn the pump and engine off.

6. Remove the ignition key and disconnect the battery. **Think SAFETY!** Check the hydraulic gauges on the panel and make sure the accumulator pressure gauge reads zero. One piston should be in the fully discharged position at the end of the concrete cylinder.

7. Remove the three 3/8-16 × 3" bolts from the piston. Remove the front faceplate.

8. Install two of the 3/8-16 × 3" bolts back into the piston, but **DO NOT** tighten. Use the two bolts as leverage to remove the rubber piston cup and rear components.

9. Obtain two 3/8-16 × 7" full thread studs. These studs will be used to assist in assembly alignment. Insert the two studs into the piston adapter. Coat the concrete cylinder with grease.

10. Install the O-ring around the oiler plate. Install the plate into the concrete cylinder utilizing the studs for alignment.

11. Install the felt holder over the oiler plate. Install the felt ring into the felt holder. Install the bronze ring.

12. Using silicon sealant, place a small bead of sealant material on the front of the rubber piston cup and the rear of the face plate. Install over the alignment studs and into the concrete cylinders.

13. Insert one 3/8-16 × 3" bolt into the open bolt hole. Remove the alignment studs one at a time and install the remaining 3/8-16 × 3" bolts.

**NOTICE**

Before installing the 3/8" bolts, coat the back of the bolt heads with silicon sealant. Torque all three bolts equally at 55 lbf-ft each.
Wear Plate and Cutting Ring Replacement

Due to the swinging motion of the nun plate and the abrasive nature of concrete, it is normal for the cutting ring to wear on the side that shears through the concrete inside the hopper.

If the wear ring and wear plate do not fully seat against each other the concrete slurry will pump into the hopper. This condition can be easily observed by the sudden change of the level of concrete inside the hopper during each stroke.

1. Remove the two hydraulic hoses connected to the remix motor. Plug the ports with fittings (not provided) to prevent hydraulic hose leakage.
2. Remove the hopper discharge nipple and loosen the sleeve seal. Inspect and replace if wear is excessive.
3. Remove the two tie rod nuts and the four eyebolt nuts securing the hopper to the pump frame.
4. Using an approved lifting device, remove the hopper using extreme care to not damage the hopper seal.
5. Remove the four 1/2" × 1-1/4" bolts securing the shuttle tube to the nun plate and remove the shuttle tube.
6. Using two small pry bars, remove the rubber energizer ring, steel insert ring, and wear ring.
7. Clean out all concrete buildup in and around the nun plate area with a wire brush.
8. Inspect the wear components for indications of wear. The wear plate has two wear surfaces.

Wear Plate Installation

1. Install the two cylinder O-rings.
2. Using silicon sealant, coat the circumference of the concrete cylinders, the back of the wear plate, and around the 5 bolt holes.
3. Install the wear plate and the 5 bolts. The bolts must all be equally snugged and tightened to 100 lbf-ft each.

Wear Ring Installation

1. Install the wear ring into the nun plate.
2. Install the steel insert ring inside the rubber energizer ring.
3. Install the energizer ring assembly into the nun plate.
4. Reassemble the machine by reversing steps 1–5 of the Wear Plate and Cutting Ring Replacement procedure.

HEAT EXCHANGER COOLING FAN

This section is intended to make sure the cooling fan is working properly. Under normal conditions the fan should be running any time the engine is turned on.

NOTICE

If the hydraulic oil temperature exceeds 170°F (77°C), shut down the pump. DO NOT continue to operate the pump. Failure to shut down the pump will result in severe damage to the pump.

PRESSURE TEST

1. To determine the pressure of the hydraulic system, set the cylinder stroke control switch (Figure 59) to the JOG position.

AUTOMATIC — JOG

CENTER
OFF

Figure 59. Cylinder Stroke Control Switch (JOG)
2. Place and hold the *manual cylinder jogging switch* (Figure 60) in either the JOG “A” or JOG “B” position to test the pressure of that particular cylinder.

![Figure 60. Manual Cylinder Jogging Switch](image)

3. The *pumping pressure gauge* (Figure 61) should read approximately 4,300–4,400 psi.

![Figure 61. Pumping Pressure Gauge](image)

**LONG-TERM STORAGE (PUMP)**

1. Remove the battery.
2. Drain the fuel tank completely. Treat with a fuel stabilizer if necessary.
3. Clean the exterior with a cloth soaked in clean oil.
4. Cover the unit with a plastic sheet and store it out of direct sunlight in a moisture- and dust-free location.

**CAUTION**

*NEVER* store the pump with fuel in the tank for an extended period of time. *ALWAYS* clean up spilled fuel immediately.

**LONG-TERM STORAGE (TRAILER)**

1. Check the brake system for proper fluid level in the master cylinder and bleed all lines.
2. Lubricate all links and pivots to prevent any rusting.
3. Remove wheel and drum assemblies and spray a good anti-corrosion compound (CRC formula 5-56) under the rubber boot on the forward end of the brake wheel cylinder. Avoid spraying the drum and brake lining.
4. Grease all bearings and reinstall the wheel and drum assemblies.
5. Make sure the breakaway cable is fully released.
6. After extended storage, refer to the following *Trailer Maintenance* section to ensure that the trailer is ready for towing.
The following trailer maintenance guidelines are intended to assist the operator in preventive maintenance.

**TRAILER BRAKES**

Properly functioning brake shoes and drums are essential to ensure safety. The brakes should be inspected after the first 200 miles of operation. This will allow the brake shoes and drums to seat properly. After the first 200-mile interval, inspect the brakes every 3,000 miles. If driving over rough terrain, inspect the brakes more frequently.

**HYDRAULIC BRAKES**

If your trailer has hydraulic brakes, they function the same way the surge brakes do on your tow vehicle. The hydraulic braking system must be inspected at least as often as the brakes on the tow vehicle, but no less than once per year. This inspection includes an assessment of the condition and proper operation of the wheel cylinders, brake shoes, brake drums and hubs.

**Manually Adjusting the Brakes**

Most axles are fitted with a brake mechanism that will adjust the brakes during a hard stop. However, some braking systems are not automatically adjusted by hard stopping. These brakes require manual adjustment. The following steps apply to adjust most manually adjustable brakes.

1. Jack up the trailer and secure it on jack stands of adequate capacity.
2. Be sure the wheel and brake drum rotate freely.
3. Remove the adjusting hole cover from the adjusting slot on the bottom of the brake backing plate.
4. With a screwdriver or standard adjusting tool, rotate the star wheel of the adjuster assembly to expand the brake shoes. Adjust the brake shoes out until the pressure of the linings against the drum makes the wheel very difficult to turn.
5. Rotate the star wheel in the opposite direction until the wheel turns freely with a slight drag.
6. Replace the adjusting hole cover.
7. Repeat the above procedure on all brakes.
8. Lower the trailer to the ground.

Check the fluid level in the master cylinder reservoir at least every 3 months. If you tow your trailer an average of 1,000 miles per month in a hot and dry environment, you must check the brake fluid level once a month. The brake fluid reservoir is located on the tongue of the trailer. ALWAYS fill with clean, uncontaminated DOT 4 brake fluid.

Figure 62 illustrates the major hydraulic brake components that will require inspection and maintenance. Please inspect these components as required using steps 1–6 in the *Manually Adjusting the Brakes* section on this page. See Table 8 for hydraulic brake troubleshooting.

**NOTICE**

Your trailer may be equipped with drop-spindle axles. See the axle manual for your axle type. You will need a modified adjusting tool for adjusting the brakes in these axles. With drop-spindle axles, a modified adjusting tool with about an 80-degree angle should be used.

**Figure 62. Hydraulic Brake Components**

**Hydraulic Brake Actuator**

The hydraulic brake actuator (Figure 63) is the mechanism that activates the trailer’s brake system. This actuator changes fluid power into mechanical power. Therefore, the fluid level must be checked frequently to assure that the brakes function properly.

**Figure 63. Hydraulic Brake Actuator**
**WARNING**

Failure to maintain the proper fluid level in the actuator may result in loss of braking action which could cause severe property damage, injury or DEATH.

Periodically check the actuator mounting fasteners for damage or loosening. Inspect the actuator for worn or damaged parts. As you are towing your trailer, be aware of any changes in braking quality. This could be an early warning of brake or actuator malfunction and requires immediate attention. Consult a certified brake specialist to make necessary adjustments or repairs.

**ADJUSTABLE CHANNEL**

Your trailer may be equipped with an adjustable channel (Figure 64) that allows the coupler to be raised or lowered to a desired height. Periodically check the channel bolts for damage or loosening.

**WARNING**

When replacing channel mounting hardware (nuts, bolts and washers), NEVER substitute with substandard hardware. Pay close attention to **bolt length** and **grade**. ALWAYS use manufacturer’s recommended parts when replacing channel mounting hardware.

**WHEEL BEARINGS**

Wheel bearings must be inspected and lubricated once a year or every 12,000 miles to ensure safe operation of the trailer.

If trailer wheel bearings are immersed in water, they must be replaced.

**DANGER**

If the trailer wheels are underwater for a long period of time, the wheel bearings may fail. If this is the case, service the wheel bearings immediately.

The possibility exists of the wheels falling off causing equipment damage and severe bodily harm or even DEATH!

If the trailer has not been used for an extended amount of time, have the bearings inspected and packed more frequently—at least every six months and prior to use.
Follow the steps below to disassemble the wheel hub and service the wheel bearings. See Figure 65.

---

**Figure 65. Wheel Hub Components**

1. After removing the dust cap, cotter pin, spindle nut and spindle washer, remove the hub to inspect the bearings for wear and damage.

2. Replace bearings that have flat spots on rollers, broken roller cages, rust or pitting. **ALWAYS** replace bearings and cups in sets. The inner and outer bearings are to be replaced at the same time.

3. Replace seals that have nicks, tears or wear.

4. Lubricate the bearings with a high-quality, EP-2 automotive wheel bearing grease.

**Wheel Hub Adjustment**

Every time the wheel hub is removed and the bearings are reassembled, follow the steps below to check the wheel bearings for free running, and adjust.

1. Turn the hub slowly, by hand, while tightening the spindle nut until you can no longer turn the hub by hand.

2. Loosen the spindle nut just until you are able to turn it (the spindle nut) by hand. **DO NOT** turn the hub while the spindle nut is loose.

3. Install a new cotter pin through the spindle nut and axle.

4. Check the adjustments. Both the hub and the spindle nut should be able to move freely. (The spindle nut motion will be limited by the cotter pin.)
TRAILER MAINTENANCE

TORSION SUSPENSION

The mounting bracket and associated components (Figure 66) should be visually inspected every 6,000 miles for signs of excessive wear, elongation of bolt holes, or loosening of fasteners. Replace all damaged parts immediately.

Figure 66. Torsion Suspension Components

⚠️ DANGER

Check the suspension regularly. Worn or broken suspension parts can cause loss of control, damage to the equipment, and severe bodily injury or even DEATH!
TRAILER GUIDELINES

The following guidelines are intended to assist the operator in the operation and handling of a trailer.

Safety precautions should be followed at all times when operating a trailer. Failure to read, understand and follow the safety guidelines could result in injury to yourself and others. Loss of control of the trailer or tow vehicle can result in death or serious injury.

COMMON CAUSES FOR LOSS OF TRAILER

- Driving too fast for the conditions (maximum speed when towing a trailer is 55 mph).
- Overloading the trailer or loading the trailer unevenly.
- Trailer improperly coupled to the hitch.
- No braking on trailer.
- Not maintaining proper tire pressure.
- Not keeping lug nuts tight.
- Not properly maintaining the trailer structure.
- Ensure machine is towed level to tow vehicle.

TRAILER TOWING GUIDELINES

- Recheck the load tiedowns to make sure the load will not shift during towing.
- Before towing, check coupling, safety chain, safety brake, tires, wheels and lights.
- Check the lug nuts or bolts for tightness.
- Check coupler tightness after towing 50 miles.
- Use your mirrors to verify that you have room to change lanes or pull into traffic.
- Use your turn signals well in advance. Allow plenty of stopping space for your trailer and tow vehicle.
- Allow plenty of stopping space for your trailer and tow vehicle.
- DO NOT drive so fast that the trailer begins to sway due to speed.
- Allow plenty of room for passing. A rule of thumb is that the passing distance with a trailer is 4 times the passing distance without the trailer.
- Shift your automatic transmission into a lower gear for city driving.
- ALWAYS use lower gears for climbing and descending grades.
- DO NOT ride the brakes while descending grades, they may get so hot that they stop working. Then you will potentially have a runaway tow vehicle and trailer.
- To conserve fuel, don’t use full throttle to climb a hill. Instead, build speed on the approach.
- Slow down for bumps in the road. Take your foot off the brake when crossing the bump.
- DO NOT brake while in a curve unless absolutely necessary. Instead, slow down before you enter the curve and power through the curve. This way, the towing vehicle remains in charge.
- DO NOT apply the brakes to correct extreme trailer swaying. Continued pulling of the trailer, and even slight acceleration, will provide a stabilizing force.
- Anticipate the trailer “swaying.” Swaying is the trailer reaction to the air pressure wave caused by passing trucks and buses. Continued pulling of the trailer provides a stabilizing force to correct swaying. DO NOT apply the brakes to correct trailer swaying.
- Use lower gear when driving down steep or long grades. Use the engine and transmission as a brake. Do not ride the brakes, as they can overheat and become ineffective.
- Be aware of your trailer height, especially when approaching roofed areas and around trees.
- Make regular stops, about once each hour. Confirm that:
  - Coupler is secure to the hitch and is locked.
  - Electrical connectors are secure.
  - There is appropriate slack in the safety chains.
  - There is appropriate slack in the breakaway switch pullpin cable.
  - Tires are not visibly low on pressure.
DRIVING CONDITIONS

When towing a trailer, you will have decreased acceleration, increased stopping distance, and increased turning radius (which means you must make wider turns to keep from hitting curbs, vehicles, and anything else that is on the inside corner). In addition, you will need a longer distance to pass, due to slower acceleration and increased length.

- Be alert for slippery conditions. You are more likely to be affected by slippery road surfaces when driving a tow vehicle with a trailer, than driving a tow vehicle without a trailer.

- Check rearview mirrors frequently to observe the trailer and traffic.

- NEVER drive faster than what is safe.

WARNING
Driving too fast for severe road conditions can result in loss of control and cause death or serious injury.
Decrease your speed as road, weather, and lighting conditions deteriorate.
Always check for local trailer tow speed limits in your area.

WARNING
Do not transport people on the trailer. The transport of people puts their lives at risk and may be illegal.

COUPLING TO THE TOW VEHICLE

Follow all of the safety precautions and instructions in this manual to ensure safety of persons, equipment, and satisfactory life of the trailer. Always use an adequate tow vehicle and hitch. If the vehicle or hitch is not properly selected and matched to the Gross Vehicle Weight Rating (GVWR) of your trailer, you can cause an accident that could lead to death or serious injury.

If you already have a tow vehicle, know your vehicle tow rating and make certain the trailer’s rated capacity is less than or equal to the tow vehicle’s rated towing capacity. If you already have (or plan to buy) a trailer, make certain that the tow rating of the tow vehicle is equal to or greater than that of the trailer.

The trailer VIN tag contains the critical safety information for the use of your trailer. Again, be sure your hitch and tow vehicle are rated for the Gross Vehicle Weight Rating of your trailer.

WARNING
Proper selection and condition of the coupler and hitch are essential to safely towing your trailer. A loss of coupling may result in death or serious injury.
- Be sure the hitch load rating is equal to or greater than the load rating of the coupler.
- Be sure the hitch size matches the coupler size.
- Observe the hitch for wear, corrosion and cracks before coupling. Replace worn, corroded or cracked hitch components before coupling the trailer to the tow vehicle.
- Be sure the hitch components are tight before coupling the trailer to the tow vehicle.

WARNING
An improperly coupled trailer can result in death or serious injury.

DO NOT move the trailer until:
- The coupler is secured and locked to hitch.
- The safety chains are secured to the tow vehicle.
- The trailer jack(s) are fully retracted.

DO NOT tow the trailer on the road until:
- Tires and wheels are checked.
- The trailer brakes are checked.
- The breakaway switch is connected to the tow vehicle.
- The load is secured to the trailer.
- The trailer lights are connected and checked.

WARNING
Use of a hitch with a load rating less than the load rating of the trailer can result in loss of control and may lead to death or serious injury.

Use of a tow vehicle with a towing capacity less than the load rating of the trailer can result in loss of control, and may lead to death or serious injury.

Be sure your hitch and tow vehicle are rated for the Gross Vehicle Weight Rating of your trailer.
INOPERABLE BRAKES, LIGHTS OR MIRRORS

Be sure that the brakes and all of the lights on your trailer are functioning properly before towing your trailer. Check the trailer taillights by turning on your tow vehicle headlights. Check the trailer brake lights by having someone step on the tow vehicle brake pedal while you look at trailer lights. Do the same thing to check the turn signal lights. See Trailer Wiring Diagram section in this manual.

Standard mirrors usually do not provide adequate visibility for viewing traffic to the sides and rear of a towed trailer. You must provide mirrors that allow you to safely observe approaching traffic.

WARNING

Improper electrical connection between the tow vehicle and the trailer will result in inoperable lights and can lead to collision.

Before each tow, check that the tail lights, brake lights and turn signals work.

TRAILER TOWING TIPS

Driving a vehicle with a trailer in tow is vastly different from driving the same vehicle without a trailer in tow. Acceleration, maneuverability and braking are all diminished with a trailer in tow.

It takes longer to get up to speed, you need more room to turn and pass, and more distance to stop when towing a trailer. You will need to spend time adjusting to the different feel and maneuverability of the tow vehicle with a loaded trailer.

Because of the significant differences in all aspects of maneuverability when towing a trailer, the hazards and risks of injury are also much greater than when driving without a trailer. You are responsible for keeping your vehicle and trailer in control, and for all the damage that is caused if you lose control of your vehicle and trailer.

As you did when learning to drive an automobile, find an open area with little or no traffic for your first practice trailering. Of course, before you start towing the trailer, you must follow all of the instructions for inspection, testing, loading and coupling. Also, before you start towing, adjust the mirrors so you can see the trailer as well as the area to the rear of it.

Drive slowly at first, 5 mph or so, and turn the wheel to get the feel of how the tow vehicle and trailer combination responds. Next, make some right and left hand turns. Watch in your side mirrors to see how the trailer turns and follows the tow vehicle. Turning with a trailer attached requires more room.

Stop the rig a few times from speeds no greater than 10 mph. If your trailer is equipped with brakes, try using different combinations of trailer brake and tow vehicle brake. Note the effect that the trailer brakes have when they are the only brakes used. When properly adjusted, the trailer brakes will come on just before the tow vehicle brakes.

It will take practice to learn how to back up a tow vehicle with a trailer attached. Take it slow. Before backing up, get out of the tow vehicle and look behind the trailer to make sure that there are no obstacles.

Some drivers place their hands at the bottom of the steering wheel, and while the tow vehicle is in reverse, “think” of the hands as being on the top of the wheel. When the hands move to the right (counterclockwise, as you would do to turn the tow vehicle to the left when moving forward), the rear of the trailer moves to the right. Conversely, rotating the steering wheel clockwise with your hands at the bottom of the wheel will move the rear of the trailer to the left while backing up.

If you are towing a bumper hitch rig, be careful not to allow the trailer to turn too much because it will hit the rear of the tow vehicle. To straighten the rig, either pull forward or turn the steering wheel in the opposite direction.

TRAILER VIN TAG

Figure A below is a sample of the Vehicle Identification Number (VIN) Tag which is typically located on the left front of the trailer. See Figure B for location.

![Figure A. Vehicle VIN Tag](Image)
Figure B. Typical VIN Tag Location

The trailer VIN Tag contains the following critical safety information for the use of your trailer.

**GAWR**: The maximum gross weight that an axle can support. It is the lowest of axle, wheel, or tire rating. Usually, the tire or wheel rating is lower than the axle rating, and determines GAWR.

**GVWR**: The maximum allowable gross weight of the trailer and its contents. The gross weight of the trailer includes the weight of the trailer and all of the items within it. GVWR is sometimes referred to as GTWR (Gross Trailer Weight Rating), or MGTW (Maximum Gross Trailer Weight). GVWR, GTWR and MGTW are all the same rating.

The sum total of the GAWR for all trailer axles may be less than the GVWR for the trailer, because some of the trailer load is to be carried by the tow vehicle, rather than by the trailer axle(s). The total weight of the cargo and trailer must not exceed the GVWR, and the load on an axle must not exceed its GAWR.

**PSIC**: The tire pressure (psi) measured when cold.

**VIN**: The Vehicle Identification Number.

**EMPTY WEIGHT**: Some information that comes with the trailer (such as the Manufacturer’s Statement of Origin) is not a reliable source for “empty” or “net” weight. The shipping documents list average or standard weights and your trailer may be equipped with options.

To determine the “empty” or “net” weight of your trailer, weigh it on an axle scale. To find the weight of the trailer using an axle scale, you must know the axle weights of your tow vehicle without the trailer coupled. Some of the trailer weight will be transferred from the trailer to the tow vehicle axles, and an axle scale weighs all axles, including the tow vehicle axles.

**TOW VEHICLE**

The towing hitch attached to your tow vehicle must have a capacity equal to or greater than the load rating of the trailer you intend to tow. The hitch capacity must also be matched to the tow vehicle capacity. Your vehicle dealer can provide and install the proper hitch on your tow vehicle.

**SUSPENSION SYSTEM**

Sway bars, shock absorbers, heavy duty springs, heavy duty tires and other suspension components may be required to sufficiently tow the trailer and pump.

**BRAKE CONTROLLER**

For trailers equipped with electric brakes, the electric brake controller is part of the tow vehicle and is essential in the operation of the electric brakes on the trailer. The brake controller is not the same as the safety breakaway brake system that may be equipped on the trailer.

**SIDE VIEW MIRRORS**

The size of the trailer that is being towed and your state law regulations determine the size of the mirrors. However, some states prohibit extended mirrors on a tow vehicle, except while a trailer is actually being towed. In this situation, detachable extended mirrors are necessary. Check with your dealer or the appropriate state agency for mirror requirements.

**HEAVY DUTY FLASHER**

A Heavy Duty Flasher is an electrical component that may be required when your trailer turn signal lights are attached to the tow vehicle flasher circuit.

**ELECTRICAL CONNECTOR**

An Electrical Connector connects the light and brake systems on the trailer to the light and brake controls on the towing vehicle.
EMERGENCY FLARES AND TRIANGLE REFLECTORS

It is wise to carry these warning devices even if you are not towing a trailer. It is particularly important to have these when towing a trailer because the hazard flashers of your towing vehicle will not operate for as long a period of time when the battery is running both the trailer lights and tow vehicle lights.

SAFETY CHAINS

If the coupler connection comes loose, the safety chains can keep the trailer attached to the tow vehicle. With properly rigged safety chains, it is possible to keep the tongue of the trailer from digging into the road pavement, even if the coupler-to-hitch connection comes apart.

TRAILER LIGHTING AND BRAKING CONNECTOR

A device that connects electrical power from the tow vehicle to the trailer. Electricity is used to turn on brake lights, running lights, and turn signals as required. In addition, if your trailer has a separate braking system, the electrical connector will also supply power to the brakes from the tow vehicle.

BREAKAWAY SYSTEM

If the trailer coupler connection comes loose, the breakaway system can actuate emergency hydraulic brakes depending on the type of actuator on the trailer. The breakaway cable must be rigged to the tow vehicle with appropriate slack that will activate the system if the coupler connection comes loose.

JACKSTAND

A device on the trailer that is used to raise and lower the coupler. The jack is sometimes called the “landing gear” or the “tongue jack”.

COUPLER TYPES

Two types of coupler used with the trailer are discussed below.

- Ball Hitch Coupler
- Pintel Eye Coupler

BALL HITCH COUPLER

A ball hitch coupler (Figure C) connects to a ball that is located on or under the rear bumper of the tow vehicle. This system of coupling a trailer to a tow vehicle is sometimes referred to as “bumper pull.”

If you see or feel evidence of wear, such as flat spots, deformations, pitting or corrosion, on the ball or coupler, immediately have your dealer inspect them to determine the proper action to prevent possible failure of the ball and coupler system. All bent or broken coupler parts must be replaced before towing the trailer.

The coupler handle lever must be able to rotate freely and automatically snap into the latched position. Oil the pivot points, sliding surfaces, and spring ends with SAE 30W motor oil. Keep the ball socket and latch mechanism clean. Dirt or contamination can prevent proper operation of the latching mechanism.

The load rating of the coupler and the necessary ball size are listed on the trailer tongue. You must provide a hitch and ball for your tow vehicle where the load rating of the hitch and ball is equal to or greater than that of your trailer.

Also, the ball size must be the same as the coupler size. If the hitch ball is too small, too large, is underrated, is loose...
or is worn, the trailer can come loose from the tow vehicle and may cause death or serious injury.

The ball size and load rating (capacity) are marked on the ball. Hitch capacity is marked on the hitch.

![WARNING]
Coupler-to-hitch mismatch can result in uncoupling, leading to death or serious injury.
Be sure the LOAD RATING of the hitch ball is equal or greater than the load rating of the coupler.
Be sure the SIZE of the hitch ball matches the size of the ball coupler.

![WARNING]
A worn, cracked or corroded hitch ball can fail while towing and may result in death or serious injury.
Before coupling trailer, inspect the hitch ball for wear, corrosion and cracks.
Replace worn or damaged hitch ball.

![WARNING]
A loose hitchball nut can result in uncoupling, leading to death or serious injury.
Be sure the hitch ball is tight to the hitch before coupling the trailer.

- Rock the ball to make sure it is tightened to the hitch, and visually check that the hitch ball nut is solid against the lock washer and hitch frame.
- Wipe the inside and outside of the coupler. Clean and visually inspect it for cracks and deformations. Feel the inside of the coupler for worn spots and pits.
- Be sure the coupler is secured tightly to the tongue of the trailer. All coupler fasteners must be visibly solid against the trailer frame.
- The bottom surface of the coupler must be above the top of the hitch ball. Use the tongue jackstand to support the trailer tongue. Wood or concrete blocks may also be used.

**Coupling the Trailer to the Tow Vehicle (Ball Coupler)**

- Lubricate the hitch ball and the inside of the coupler with a thin layer of automotive bearing grease.
- Slowly back up the tow vehicle so that the hitch ball is near or aligned under the coupler.
- Using the jackstand at the front of trailer (tongue), turn the jackstand crank handle to raise the trailer. If the ball coupler does not line up with the hitch ball, adjust the position of the tow vehicle.
- Open the coupler locking mechanism. Ball couplers have a locking mechanism with an internal moving piece and an outside handle. In the open position, the coupler is able to drop fully onto the hitch ball.
- Lower the trailer (Figure D) until the coupler fully engages the hitch ball.

![Figure D. Ball Hitch Coupling Mechanism]

- Engage the coupler locking mechanism. In the engaged position, the locking mechanism securely holds the coupler to the hitch ball.
- Insert a pin or lock through the hole in the locking mechanism.
- Be sure the coupler is all the way on the hitch ball and the locking mechanism is engaged. A properly engaged locking mechanism will allow the coupler to raise the rear of the tow vehicle. Using the trailer jackstand, verify that you can raise the rear of the tow vehicle by 1 inch after the coupler is locked to the hitch.
- Lower the trailer so that its entire tongue weight is held by the hitch.
- Raise the jackstand to a height where it will not interfere with the road.
If the coupler cannot be secured to the hitch ball, do not tow the trailer. Call your dealer for assistance. Lower the trailer so that its entire tongue weight is held by the hitch and continue retracting the jack to its fully retracted position.

Attaching Safety Chain

Visually inspect the safety chains and hooks for wear or damage. Replace worn or damaged safety chains and hooks before towing.

Attach the safety chains so that they:

• Cross underneath the coupler. See Figure E.

Figure E. Attaching Safety Chain (Ball Hitch)

• Loop around a frame member of the tow vehicle or holes provided in the hitch system (DO NOT attach them to an interchangeable part of the hitch assembly).

• Have enough slack to permit tight turns, but not be close to the road surface, so if the trailer uncouples, the safety chains can hold the tongue up above the road.

Breakaway Brake System

If the coupler or hitch fails, a properly connected and working breakaway brake system (Figure F) will apply the hydraulic brakes on the trailer. The safety chains will keep the tow vehicle attached and as the brakes are applied at the trailer’s axles, the trailer/tow vehicle combination will come to a controlled stop.

Figure F. Breakaway Brake System

Breakaway Cable Surge Brake System

The breakaway brake system includes a brake cable connected to the tow vehicle on one end and to the emergency brake lever located on the hydraulic actuator on the other end.

WARNING

• An ineffective breakaway brake system can result in a runaway trailer, leading to death or serious injury, if the coupler or ball hitch fails.

• Connect the breakaway cable to the tow vehicle and NOT to the hitch, ball or support.

• Before towing the trailer, test the function of the breakaway brake system. If the breakaway brake system is not working, DO NOT tow the trailer. Have it serviced or repaired.

WARNING

DO NOT tow the trailer with the breakaway brake system ON because the brakes will overheat which can result in permanent brake failure.

NOTICE

Replace the breakaway brake battery (if equipped) at intervals specified by manufacturer.
Connecting Trailer Lights

Connect the trailer lights to the tow vehicle’s electrical system using the electric connectors at the front of the trailer (tongue). Refer to the wiring diagram shown in the trailer wiring diagram section of this manual. Before towing check the following:

- Running lights (turn on tow vehicle headlights).
- Brake Lights (step on tow vehicle brake pedal).
- Backup Lights (place tow vehicle gear shift in reverse).
- Turn Signals (activate tow vehicle directional signal lever).

**WARNING**

Improper electrical connection between the tow vehicle and the trailer will result in inoperable lights and electric brakes, and can lead to collision.

Before each tow:

- Check that the taillights, brake lights and turn signals work.
- Check that the electric brakes work by operating the brake controller inside the tow vehicle.

Uncoupling the Ball Hitch

Follow these steps to uncouple ball hitch from tow vehicle:

- Block trailer tires to prevent the trailer from rolling, before jacking the trailer up.
- Disconnect the electrical connector.
- Disconnect the breakaway brake switch cable. Promptly replace the pullpin in the switchbox.
- Before extending jackstand, make certain the ground surface below the jackstand foot will support the tongue load.
- Rotate the jackstand handle (or crank) clockwise. This will slowly extend the jack and transfer the weight of the trailer tongue to the jack.

PINTLE HITCH COUPLER

A pintle eye coupler (Figure G) connects to a pintle-hook hitch that is located on or under the rear bumper of the tow vehicle. This system of coupling a trailer to a tow vehicle is sometimes referred to as a “lunette eye, tow ring or G.I. hitch.”

![Figure G. Pintle Hitch Coupler](image)

A pintle hitch trailer may be fitted with a tongue jackstand that can raise and lower the coupler. The tongue jack is mounted to the A-frame (front or tongue) part of the trailer. By rotating the jack handle clockwise, the jack will extend and raise the tongue of the trailer.

The load rating of the coupler and the necessary pintle hitch size are listed on the trailer tongue. You must provide a pintle hitch and pintle coupler for your tow vehicle, where the load rating of the pintle hitch and pintle coupler is equal to or greater than that of your trailer.

Also, the pintle hitch size must be the same as the pintle coupler size. If the hitch is too small, too large, underrated, loose or worn, the trailer can come loose from the tow vehicle, and may cause death or serious injury.

**Pintle Coupler and Pintle Hook**

Before each tow, check the locking device that secures the coupler to the pintle hook assembly.

The pintle hook lever must be able to operate freely and automatically snap into place into the latched position. Lightly oil the pivot points and sliding surfaces with SAE30W motor oil to prevent rust and help ensure proper operation of the latching mechanism.

If you see or feel evidence of wear, such as flat spots, deformations, pitting or corrosion, on the pintle hook or coupler, immediately have your dealer inspect them to determine the proper action to prevent possible failure of
the ball and coupler system. All bent or broken coupler parts must be replaced before towing the trailer.

THE TOW VEHICLE, PINTLE HITCH AND PINTLE COUPLER MUST HAVE A RATED TOWING CAPACITY EQUAL TO OR GREATER THAN THE TRAILER Gross Vehicle Weight Rating (GVWR).

IT IS ESSENTIAL THAT THE PINTLE HITCH BE OF THE SAME SIZE AS THE PINTLE COUPLER.

The coupler size and load rating (capacity) are marked on the coupler. Hitch capacity is marked on the hitch.

**WARNING**

Coupler-to-hitch mismatch can result in uncoupling, leading to death or serious injury.

Be sure the LOAD RATING of the pintle hitch hook is equal or greater than the load rating of the pintle eye coupler.

Be sure the SIZE of the pintle hitch hook matches the size of the pintle eye coupler.

**WARNING**

A worn, cracked or corroded pintle hitch hook can fail while towing, and may result in death or serious injury.

Before coupling trailer, inspect the pintle hitch hook for wear, corrosion and cracks.

Replace worn or damaged pintle hitch hook.

- Rock the pintle eye coupler to make sure it is secured tightly to the hitch.
- Wipe the inside and outside of the pintle coupler. Clean and inspect it visually for cracks and deformations. Feel the inside of the coupler for worn spots and pits.
- Be sure the coupler is secured tightly to the tongue of the trailer. All coupler fasteners must be visibly solid against the trailer frame.
- Raise the bottom surface of the coupler to be above the top of the pintle hitch hook. Use the tongue jackstand to support the trailer tongue. Wood or concrete blocks may also be used.

**WARNING**

A defective pintle hitch not properly fastened can result in uncoupling, leading to death or serious injury.

Be sure the pintle hook is securely tighten to the tow vehicle before coupling the trailer.

**Coupling Trailer to Tow Vehicle (Pintle Coupler)**

- Slowly back up the tow vehicle so that the pintle hitch hook is near or aligned under the pintle eye ring coupler.
- Using the jackstand at the front of trailer (tongue), turn the jackstand crank handle to raise the trailer. If the pintle eye coupler does not line up with the pintle hitch hook, adjust the position of the tow vehicle.
- OPEN the pintle hook locking mechanism (Figure H). Place the hook inside the eye coupler. CLOSE the pintle hook mechanism.

**Figure H. Attaching Safety Chain (Pintle Hitch)**

- Insert a pin or lock through the hole in the locking mechanism.
- Be sure the pintle hook is inserted completely through the eye ring and the locking mechanism is engaged. A properly engaged locking mechanism will allow the coupler to raise the rear of the tow vehicle. Using the trailer jack, test to see that you can raise the rear of the tow vehicle by 1-inch after the coupler is locked to the hitch.
- Lower the trailer so that its entire tongue weight is held by the hitch.
- Raise the jackstand to a height where it will not interfere with the road.
TIRE SAFETY

Unsafe Tires, Lug Nuts or Wheels

Trailer tires and wheels are more likely to fail than car tires and wheels because they carry a heavier load. Therefore, it is essential to inspect the trailer tires before each tow.

If a tire has a bald spot, bulge, cuts, is showing any cords, or is cracked, replace the tire before towing. If a tire has uneven tread wear, take the trailer to a dealer service center for diagnosis.

Uneven tread wear can be caused by tire imbalance, axle misalignment or incorrect inflation.

Tires with too little tread will not provide adequate tracking on wet roadways and can result in loss of control, leading to death or serious injury.

Improper tire pressure causes an unstable trailer and can result in a tire blowout and loss of control. Therefore, before each tow you must also check the tire pressure. Tire pressure must be checked when tires are cold.

Allow 3 hours cool-down after driving as much as 1 mile at 40 mph before checking tire pressure. Trailer tires will be inflated to higher pressures than passenger vehicle tires.

Since trailer wheels and lug nuts (or bolts) are subjected to greater side loads than automobile wheels, they are more prone to loosen. Before each tow, check to make sure they are tight.

The proper tightness (torque) for lug nuts is listed in the lug nut tightening section of this manual. Use a torque wrench to tighten the lug nuts. If you do not have a torque wrench, use a lug wrench (from your tow vehicle) and tighten the nuts as much as you can. Then have a service garage or trailer dealer tighten the lug nuts to the proper torque.

Lug nuts are also prone to loosen after initial installation, which can lead to death or serious injury.

Check lug nuts for tightness on a new trailer or when wheel(s) have been remounted after the first 10, 25 and 50 miles of driving.

Lug nuts are prone to loosen after first being assembled. When driving a new trailer (or after wheels have been remounted), check to make sure they are tight after the first 10, 25 and 50 miles of driving and before each tow thereafter.

Failure to perform this check can result in a wheel parting from the trailer and a crash, leading to death or serious injury.

TRAILER GUIDELINES

Determining Load Limit of Trailer

Determining the load limits of a trailer includes more than understanding the load limits of the tires alone. On all trailers there is a Federal certification/VIN label that is located on the forward half of the left (road) side of the unit. This certification/VIN label will indicate the trailer’s Gross Vehicle Weight Rating (GVWR). This is the most weight the fully loaded trailer can weigh. It will also provide the Gross Axle Weight Rating (GAWR). This is the most a the axle can weigh.

WARNING

Lug nuts are prone to loosen after initial installation, which can lead to death or serious injury.

Check lug nuts for tightness on a new trailer or when wheel(s) have been remounted after the first 10, 25 and 50 miles of driving.

WARNING

Improper lug nut torque can cause a wheel parting from the trailer, leading to death or serious injury.

Be sure lug nuts are tight before each tow.

WARNING

Improper tire pressure can result in a blowout and loss of control, which can lead to death or serious injury.

Be sure tires are inflated to pressure indicated on side wall before towing trailer.

Determining Load Limit of Trailer

Determining the load limits of a trailer includes more than understanding the load limits of the tires alone. On all trailers there is a Federal certification/VIN label that is located on the forward half of the left (road) side of the unit. This certification/VIN label will indicate the trailer’s Gross Vehicle Weight Rating (GVWR). This is the most weight the fully loaded trailer can weigh. It will also provide the Gross Axle Weight Rating (GAWR). This is the most a the axle can weigh.
There is a vehicle placard (Figure I) located in the same location as the certification label described above. This placard provides tire and loading information. In addition, this placard will show a statement regarding maximum cargo capacity.

**Figure I. Trailer Tire Placard**

If additional work items (hoses, tools, clamps etc.) are going to be added to the trailer, be sure they are distributed evenly to prevent overloading front to back and side to side. Heavy items should be placed low and as close to the axle positions as reasonable. Too many items on one side may overload a tire.

Excessive loads and/or underinflation cause tire overloading and, as a result, abnormal tire flexing occurs. This situation can generate an excessive amount of heat within the tire. Excessive heat may lead to tire failure. It is the air pressure that enables a tire to support the load, so proper inflation is critical. The proper air pressure may be found on the certification/VIN label and/or on the Tire and Loading Information placard. This value should never exceed the maximum cold inflation pressure stamped on the tire.

Perform the following steps to determine the load limit of your trailer.

**Step 1.**
Locate the statement, “The weight of cargo should never exceed XXX kg or XXX lbs.,” on your vehicle’s Tire and Loading Information placard (Figure I). This value equals the available amount of equipment load capacity.

**Step 2.**
Determine the weight of the equipment being loaded on the tow vehicle. That weight may not safely exceed the available equipment load capacity. The trailer’s Tire Information Placard is attached adjacent to or near the trailer’s VIN (Certification) label at the left front of the trailer (See Figure I).

**Determining Load Limit of Tow Vehicle**

**Step 1.**
Locate the statement, “The combined weight of occupants and cargo should never exceed XXX lbs.,” on your vehicle’s placard.

**Step 2.**
Determine the combined weight of the driver and passengers who will be riding in your vehicle.

**Step 3.**
Subtract the combined weight of the driver and passengers from XXX kilograms or XXX pounds.

**Step 4.**
The resulting figure equals the available amount of cargo and luggage capacity. For example, if the “XXX” amount equals 1400 lbs. and there will be five 150 lb. passengers in your vehicle, the amount of available cargo and luggage capacity is 650 lbs. (1400-750 (5 x 150) = 650 lbs.).

**Step 5.**
Determine the combined weight of luggage and cargo being loaded on the vehicle. That weight may not safely exceed the available cargo and luggage capacity calculated in Step 4.

If your vehicle will be towing a trailer, load from your trailer will be transferred to your vehicle. Consult the tow vehicle’s manual to determine how this weight transfer reduces the available cargo and luggage capacity of your vehicle.

Studies of tire safety show that maintaining proper tire pressure, observing tire and vehicle load limits (not carrying more weight in your vehicle than your tires or vehicle can safely handle), avoiding road hazards and inspecting tires for cuts, slashes and other irregularities are the most important things you can do to avoid tire failure, such as tread separation or blowout and flat tires. These actions, along with other care and maintenance activities, can also:

- Improve vehicle handling.
- Help protect you and others from avoidable breakdowns and accidents.
- Improve fuel economy.
- Increase the tire life.
Use the information contained in this section to make tire safety a regular part of your vehicle maintenance routine. Recognize that the time you spend is minimal compared with the inconvenience and safety consequences of a flat tire or other tire failure.

**TIRE FUNDAMENTALS**

Federal law requires tire manufacturers to place standardized information on the sidewall of all tires (Figure J). This information identifies and describes the fundamental characteristics of the tire and also provides a tire identification number for safety standard certification and in case of a recall.

**Figure J. Standard Tire Sidewall Information**

- **P**: The “P” indicates the tire is for passenger vehicles.
- **Next number**: This three-digit number gives the width in millimeters of the tire from sidewall edge to sidewall edge. In general, the larger the number, the wider the tire.
- **Next number**: This two-digit number, known as the aspect ratio, gives the tire’s ratio of height to width. Numbers of 70 or lower indicate a short sidewall for improved steering response and better overall handling on dry pavement.
- **P**: The “R” stands for radial. Radial ply construction of tires has been the industry standard for the past 20 years.
- **Next number**: This two-digit number is the wheel or rim diameter in inches. If you change your wheel size, you will have to purchase new tires to match the new wheel diameter.
- **Next number**: This two- or three-digit number is the tire’s load index. It is a measurement of how much weight each tire can support. You may find this information in your owner’s manual. If not, contact a local tire dealer. **Note**: You may not find this information on all tires because it is not required by law.

**M+S**: The “M+S” or “M/S” indicates that the tire has some mud and snow capability. Most radial tires have these markings; hence, they have some mud and snow capability.

**Speed Rating**: The speed rating denotes the speed at which a tire is designed to be driven for extended periods of time. The ratings range from 99 miles per hour (mph) to 186 mph. These ratings are listed in Table A. Note: You may not find this information on all tires because it is not required by law.

<table>
<thead>

<tr>
<td>Y</td>
<td>186* mph</td>
</tr>
</tbody>
</table>

**U.S. DOT Tire Identification Number**: This begins with the letters “DOT” and indicates that the tire meets all federal standards. The next two numbers or letters are the plant code where it was manufactured, and the last four numbers represent the week and year the tire was built. For example, the numbers 3197 means the 31st week of 1997. The other numbers are marketing codes used at the manufacturer’s discretion. This information is used to contact consumers if a tire defect requires a recall.

**Tire Ply Composition and Materials Used**: The number of plies indicates the number of layers of rubber-coated fabric in the tire. In general, the greater the number of plies, the more weight a tire can support. Tire manufacturers also must indicate the materials in the tire, which include steel, nylon, polyester, and others.

**Maximum Load Rating**: This number indicates the maximum load in kilograms and pounds that can be carried by the tire.

**Maximum Permissible Inflation Pressure**: This number is the greatest amount of air pressure that should ever be put in the tire under normal driving conditions.

**TRAILER GUIDELINES**

- **Table A. Speed Rating**
  
- **Letter Rating**
  - Q: 99 mph
  - R: 106 mph
  - S: 112 mph
  - T: 118 mph
  - U: 124 mph
  - H: 130 mph
  - V: 149 mph
  - W: 168* mph
  - Y: 186* mph
Uniform Tire Quality Grading Standards (UTQGS)

Treadwear Number: This number indicates the tire’s wear rate. The higher the treadwear number is, the longer it should take for the tread to wear down. For example, a tire graded 400 should last twice as long as a tire graded 200.

Traction Letter: This letter indicates a tire’s ability to stop on wet pavement. A higher graded tire should allow you to stop your car on wet roads in a shorter distance than a tire with a lower grade. Traction is graded from highest to lowest as “AA”, “A”, “B”, and “C”.

Temperature Letter: This letter indicates a tire’s resistance to heat. The temperature grade is for a tire that is inflated properly and not overloaded. Excessive speed, underinflation or excessive loading, either separately or in combination, can cause heat build-up and possible tire failure. From highest to lowest, a tire’s resistance to heat is graded as “A”, “B”, or “C”.

Refer to Figure K for additional tire information for light trucks.

Tire Safety Tips

- Slow down if you have to go over a pothole or other object in the road.
- DO NOT run over curbs or other foreign objects in the roadway, and try not to strike the curb when parking.
- Check tire inflation pressure weekly during use to insure the maximum tire life and tread wear.
- DO NOT bleed air from tires when they are hot.
- Inspect tires for uneven wear patterns on the tread, cracks, foreign objects, or other signs of wear or trauma.
- Remove bits of glass and foreign objects wedged in the tread.
- Make sure your tire valves have valve caps.
- ALWAYS check tire pressure on tow vehicle and trailer before towing. Check tire pressure at least once a month.
- DO NOT overload tow vehicle. Check the tire information and loading placard for safe allowable tire loading conditions.

Tire Repair

The proper repair of a punctured tire requires a plug for the hole and a patch for the area inside the tire that surrounds the puncture hole. Punctures through the tread can be repaired if they are not too large, but punctures to the sidewall should not be repaired. Tires must be removed from the rim to be properly inspected before being plugged and patched.

Replacing Worn or Damaged Tires

Replace the tire before towing the trailer if the tire treads have less than 1/16 inch depth or the telltale bands are visible. Check inflation pressure weekly during use to insure the maximum tire life and tread wear. A bubble, cut or bulge in a side wall can result in a tire blowout. Inspect both side walls of each tire for any bubble, cut or bulge; and replace a damaged tire before towing the trailer.
Table B below will help pinpoint the causes and solutions of tire wear problems.

<table>
<thead>
<tr>
<th>Wear Pattern</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Center Wear</td>
<td>Over inflation</td>
<td>Adjust pressure to particular load per tire manufacturer.</td>
</tr>
<tr>
<td>Edge Wear</td>
<td>Under inflation</td>
<td>Adjust pressure to particular load per tire manufacturer.</td>
</tr>
<tr>
<td>Side Wear</td>
<td>Loss of camber or overloading</td>
<td>Make sure load does not exceed axle rating. Align wheels.</td>
</tr>
<tr>
<td>Toe Wear</td>
<td>Incorrect toe-in</td>
<td>Align wheels.</td>
</tr>
<tr>
<td>Cupping</td>
<td>Out-of-balance</td>
<td>Check bearing adjustment and balance tires.</td>
</tr>
<tr>
<td>Flat Spots</td>
<td>Wheel lockup and tire skidding</td>
<td>Avoid sudden stops when possible and adjust brakes.</td>
</tr>
</tbody>
</table>

**WARNING**

ALWAYS wear safety glasses when removing or installing force fitted parts. **DO NOT** attempt to repair or modify a wheel. **DO NOT** install an inner-tube to correct a leak through the rim. If the rim is cracked, the air pressure in the inner tube may cause pieces of the rim to explode (break off) with great force and cause serious eye or bodily injury.

**NOTICE**

NEVER use a pneumatic air gun to tighten wheel lug nuts. Over-tightening lug nuts will result in breaking the studs or permanently deforming the mounting stud holes in the wheels.

**WARNING**

Lug nuts are prone to loosen after initial installation, which can lead to death or serious injury. Check all wheel lug nuts periodically.

**Lug Nut Torque Requirements**

It is extremely important to apply and maintain proper wheel mounting torque on the trailer. Be sure to use only the fasteners matched to the cone angle of the wheel. Proper procedure for attachment of the wheels is as follows:

1. Start all wheel lug nuts by hand.
2. Torque all lug nuts in sequence. See Figure L. **DO NOT** torque the wheel lug nuts all the way down. Tighten each lug nut in 3 separate passes as defined by Table C.
3. Check to see if the lug nuts are tight after the first 10, 25 and 50 miles of driving and before each tow thereafter.

**Figure L. Wheel Lug Nuts Tightening Sequence**
## Lights and Signals

Before each tow, check the trailer taillights, stoplights, turn signals and any clearance lights for proper operation.

### Table C. Tire Torque Requirements

<td>90-120</td>
</tr>
</tbody>
</table>

Replace any broken or burned-out lamps as necessary. Check the wire harness for cuts, fraying or other damage. If it needs replacing, contact your dealer.

**WARNING**

Improper operating taillights, stoplights and turn signals can cause collisions.

Check all lights before each tow.

PAGE 72 — MAYCO LS450 CONCRETE PUMP • OPERATION MANUAL — REV. #1 (09/09/19)
APPENDIX — CONCRETE MIX INFORMATION

CONCRETE MIX INFORMATION

The following information has been extracted from actual testing laboratory reports. The purpose of this printing is only to help create a better understanding of the importance of uniform gradation and proportioning of materials which affect pumpability of concrete mixes. These weights and proportions illustrate that when the sieve analysis is ideal, the sand/rock ratio can be adjusted (65% sand 35% rock) and pumpability should be excellent.

EXAMPLE #1 (A California Test Lab. Report)

JOB: Building Foundations (Water Project)

Sacks per cu./yd. 6.5 designed for 2,500 lbs. in 28 days
Gallons per sack 7.1
Washed Sand-#200 wash 1.3
Organic matter OK
Specific gravity (SSD) Sand-2.58; Pea Gravel-2.60

</table>
SLUMP TEST PROCEDURE

1. To obtain a representative sample (concrete), take several samples at three or more regular intervals throughout the discharge of the mixer or truck. **DO NOT** take samples at the beginning or end of the discharge.

2. Dampen the inside of the cone and place it on a smooth, moist, non-absorbent, level surface large enough to accommodate both the slumped concrete and the slump cone. Stand on the "foot pieces" throughout the test procedure to hold the cone firmly in place.

3. Fill the cone 1/3 full by volume (Figure N) and rod 25 times with a 1/2" dia x 24" lg. bullet-pointed steel rod. (This is a specific requirement which will produce non-standard results unless followed exactly.) Distribute rodding evenly over the entire cross section of the sample.

4. Fill cone another 1/3 (Figure O) which will make the cone 2/3 full by volume. Rod this second layer 25 times with the rod penetrating into, but not through, the first layer. Distribute rodding evenly over the entire cross section of the layer.

5. Fill cone to overflowing (Figure P). Rod this layer 25 times with rod penetrating into, but not through, the second layer. Distribute rodding evenly over the entire cross section of this layer.

6. Remove the excess concrete (Figure Q) from the top of the cone, using the tamping rod as a screed.

7. Lift the cone vertically (Figure R) with a slow even motion. **DO NOT** jar the concrete or tilt the cone during this process. Invert the withdrawn cone, and place it next to, but not touching the slumped concrete.

8. Lay a straight edge (Figure S) across the top of the slumped cone. Measure the amount of slump in inches from the bottom of the straight edge to the top of the slumped concrete at a point over the original center of the base. The slump operation must be complete in a maximum elapsed time of 1-½ minutes. Discard the concrete. **DO NOT** use it in another test.

<td>Check for proper pressure or for contaminated relief cartridge</td>
</tr>
<tr>
<td>Hydraulic fluid gets hot</td>
<td>Cooling fan</td>
<td>Check fan electrical connection or for burnt fan motor</td>
</tr>
<tr>
<td></td>
<td>Contaminated cooler fins</td>
<td>Clean cooler fins</td>
</tr>
<tr>
<td></td>
<td>Return filter element closed</td>
<td>Replace filter</td>
</tr>
<tr>
<td></td>
<td>Main relief cartridge contaminated or set too low</td>
<td>Replace or set to proper pressure</td>
</tr>
<tr>
<td></td>
<td>Hydraulic oil level too low</td>
<td>Fill to proper level</td>
</tr>
<tr>
<td>Accumulator gauge reads below 1,750 PSI</td>
<td>Accumulator bottle low on nitrogen</td>
<td>Check precharge pressure 1,100 PSI</td>
</tr>
<tr>
<td></td>
<td>Contaminated safety relief cartridge</td>
<td>Replace cartridge</td>
</tr>
<tr>
<td></td>
<td>Defective unloader cartridge electrical coil</td>
<td>Replace</td>
</tr>
<tr>
<td></td>
<td>Unloader cartridge coil not energizing</td>
<td>Check for 12 Volt signal voltage</td>
</tr>
<tr>
<td></td>
<td>Defective gear pump</td>
<td>Replace pump</td>
</tr>
<tr>
<td>Cylinders not completely extended (short stroke)</td>
<td>Excessive amount of hydraulic on cylinder rod side</td>
<td>Inspect cylinder. Check values for contamination or faulty spring</td>
</tr>
<tr>
<td></td>
<td>Hydraulic cylinder piston head seal leaking</td>
<td>Replace seals</td>

### Troubleshooting (Diesel Engine)

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Engine will not start or start is delayed, although engine can be turned over.</td>
<td>No Fuel reaching injection pump?</td>
<td>Add fuel. Check entire fuel system.</td>
</tr>
<tr>
<td></td>
<td>Defective fuel pump?</td>
<td>Replace fuel pump.</td>
</tr>
<tr>
<td></td>
<td>Fuel filter clogged?</td>
<td>Replace fuel filter and clean tank.</td>
</tr>
<tr>
<td></td>
<td>Faulty fuel supply line?</td>
<td>Replace or repair fuel line.</td>
</tr>
<tr>
<td></td>
<td>Compression too low?</td>
<td>Check piston, cylinder and valves. Adjust or repair per engine repair manual.</td>
</tr>
<tr>
<td></td>
<td>Fuel pump not working correctly?</td>
<td>Repair or replace fuel pump.</td>
</tr>
<tr>
<td></td>
<td>Oil pressure too low?</td>
<td>Check engine oil pressure.</td>
</tr>
<tr>
<td></td>
<td>Low starting temperature limit exceeded?</td>
<td>Comply with cold starting instructions and proper oil viscosity.</td>
</tr>
<tr>
<td></td>
<td>Defective battery?</td>
<td>Charge or replace battery.</td>
</tr>
<tr>
<td></td>
<td>Air or water mixed in fuel system?</td>
<td>Check carefully for loosened fuel line coupling, loose cap nut, etc.</td>
</tr>
<tr>
<td>At low temperatures engine will not start.</td>
<td>Engine oil too thick?</td>
<td>Refill engine crankcase with correct type of oil for winter environment.</td>
</tr>
<tr>
<td></td>
<td>Defective battery?</td>
<td>Replace battery.</td>
</tr>
<tr>
<td>Engine fires but stops soon as starter is switched off.</td>
<td>Fuel filter blocked?</td>
<td>Replace fuel filter.</td>
</tr>
<tr>
<td></td>
<td>Fuel supply blocked?</td>
<td>Check the entire fuel system.</td>
</tr>
<tr>
<td></td>
<td>Defective fuel pump?</td>
<td>Replace fuel pump.</td>
</tr>
<tr>
<td></td>
<td>Fuel filter blocked?</td>
<td>Replace fuel filter.</td>
</tr>
<tr>
<td></td>
<td>Defective fuel pump?</td>
<td>Replace fuel pump.</td>
</tr>
<tr>
<td></td>
<td>Mechanical oil pressure shutdown sensor stops the engine due to low oil?</td>
<td>Add oil. Replace low oil shutdown sensor if necessary.</td>
</tr>
<tr>
<td>Low engine power, output and speed.</td>
<td>Fuel tank empty?</td>
<td>Replace fuel filter.</td>
</tr>
<tr>
<td></td>
<td>Fuel filter clogged?</td>
<td>Replace fuel filter.</td>
</tr>
<tr>
<td></td>
<td>Fuel tank venting is inadequate?</td>
<td>Ensure that tank is adequately vented.</td>
</tr>
<tr>
<td></td>
<td>Leaks at pipe unions?</td>
<td>Check threaded pipe unions tape and tighten unions a required.</td>
</tr>
<tr>
<td></td>
<td>Speed control lever does not remain in selected position?</td>
<td>See engine manual for corrective action.</td>
</tr>
<tr>
<td></td>
<td>Engine oil level too full?</td>
<td>Correct engine oil level.</td>
</tr>
<tr>
<td></td>
<td>Injection pump wear?</td>
<td>Use No. 2-D diesel fuel only. Check the fuel injection pump element and delivery valve assembly and replace as necessary.</td>
</tr>
<tr>
<td>Symptom</td>
<td>Possible Problem</td>
<td>Solution</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>No brakes</td>
<td>Is the brake line broken or kinked?</td>
<td>Repair or replace.</td>
</tr>
<tr>
<td></td>
<td>Is the brake lining glazed?</td>
<td>Reburnish or replace.</td>
</tr>
<tr>
<td></td>
<td>Is the trailer overloaded?</td>
<td>Correct weight.</td>
</tr>
<tr>
<td>Weak brakes or brakes pull to one side</td>
<td>Are the brake drums scored or grooved?</td>
<td>Check machine or replace.</td>
</tr>
<tr>
<td></td>
<td>Is the tire pressure correct?</td>
<td>Inflate all tires equally per manufacturer guidelines.</td>
</tr>
<tr>
<td></td>
<td>Are the tires unmatched on the same axle?</td>
<td>Match tires.</td>
</tr>
<tr>
<td>Locking brakes</td>
<td>Are the brake components loose, bent or broken?</td>
<td>Replace components.</td>
</tr>
<tr>
<td></td>
<td>Are the brake drums out-of-round?</td>
<td>Replace.</td>
</tr>
<tr>
<td>Noisy brakes</td>
<td>Is the brake system lubricated?</td>
<td>Lubricate.</td>
</tr>
<tr>
<td></td>
<td>Are the correct brake components installed?</td>
<td>Replace and correct.</td>
</tr>
<tr>
<td>Dragging brakes</td>
<td>Is the brake lining thickness correct or installed incorrectly?</td>
<td>Install new shoes and linings.</td>
</tr>
<tr>
<td></td>
<td>Is there enough brake fluid or correct fluid?</td>
<td>Fill with DOT 4 fluid.</td>
</tr>
<tr>
<td>Brakes squeak, chatter or chuck</td>
<td>Overheated wheel bearing</td>
<td>Replace wheel bearing and pack with grease.</td>
</tr>
<tr>
<td></td>
<td>Low brake fluid</td>
<td>Fill and bleed brake system.</td>
</tr>
<tr>
<td></td>
<td>Seized actuator master cylinder</td>
<td>Replace/Rebuild master cylinder.</td>
</tr>
<tr>
<td></td>
<td>Brake shoe noise</td>
<td>Inspect drums. Adjust shoes or replace if necessary.</td>
</tr>
<tr>
<td>Brakes overheat, fail to operate, pull to</td>
<td>Leaking wheel cylinder</td>
<td>Check and replace wheel cylinder and bleed brake system.</td>
</tr>
<tr>
<td>the side, or function poorly</td>
<td>Low brake fluid level</td>
<td>Fill with dot approved brake fluid and bleed brake system.</td>
</tr>
<tr>
<td></td>
<td>Brake actuator frame damage</td>
<td>Replace complete actuator unit.</td>
</tr>
<tr>
<td></td>
<td>Brake line being pinched</td>
<td>Replace brake line.</td>
</tr>
<tr>
<td></td>
<td>Seized actuator</td>
<td>Replace or rebuild actuator.</td>
</tr>
<tr>
<td></td>
<td>Broken return spring</td>
<td>Replace spring.</td>
</tr>
<tr>
<td></td>
<td>Brakes improperly adjusted</td>
<td>Check adjustment.</td>
</tr>
<tr>
<td></td>
<td>Break-away cable system partially activated</td>
<td>Break-away cable might be pulled. Determine cause and correct. Pry up on cable until indicator bead touches or rests against cable spring stop. This will fully release the frame brakes and prevent drag.</td>
</tr>
<tr>
<td>Malfunction Reading (Screen 1)</td>
<td>Possible Problem</td>
<td>Solution</td>
</tr>
<tr>
<td>-------------------------------</td>
